From: rbethman
Topic: 4635  Message: 4635

Roger,

The antenna shorting relay is most likely another one of those "old" wiring harness issues. A royal PIA to sort through, but would most likely benefit from tracing it through and rewiring or reworking the terminal boards.

Blocked open as you have done, shouldn't be an issue. There really ins't much to be considered with, as the "residual" RF should die off rapidly when un-keyed.

Bob - N0DGN

Alan,

That really would depend on what voltages you are seeing.

If the voltages are higher, I'd consider using the 3B28 solution, simply because of the age of the power transformer and other transformers in use. You don't want one to get fried. They really aren't an on-the-shelf item.

# 4638. RELAY

Yahoo group: T-368_BC-610
Date: 2011-09-04 18:02:34 UTC
From: Alan Morriss
Topic: 4638  Message: 4638

hello roger, as i understand it the purpose of the antenna shorting relay is to prevent radiated rf noise interfering with reception as the antennas are so close together on the truck . i do not suppose it does anything in a set up like yours. i used the supply to operate a johnson kilowatt matchbox . it worked very well. alan

From: Roger Basford
Topic: 4635  Message: 4639

Hi Bob,

I think you're right; I have checked the continuity through the relay coil and the wiring back to the main HV relay on the modulator deck and they are OK. I should say that I have had the exciter deck off the rig this weekend to sort out a bad connection on the driver tube base and I may have disturbed the relay wiring, I will check tomorrow. I had some of the wires drop off the PL1 Jones plug, old age again and some of the other wiring is getting "crispy" insulation!

When I first got the TX up and running back in 2007, there was a considerable amount of noise generated in the RX with the TX on but I found that the RY4 shorting relay had dirty contacts and cleaning them cured the noise, so I will spend the time to get it working again. Believe that I have a used spare if there is a problem with the existing one.

Thanks for all the assistance, much appreciated.

From: Roger Basford
Topic: 4638  Message: 4640

Hi Alan,

I did have an issue with that relay when I first got the '610 going and see from my project book that noise was a problem at that time and that it came down to dirty relay contacts, so it's worth getting the system going again, I feel. I tend to use an active loop on receive, via a ex-USN distribution amplifier, and that set-up is quite sensitive to TX generated noise.

# 4641. FS: Enamel covered copper wire

Yahoo group: T-368_BC-610
Date: 2011-09-09 20:06:29 UTC
From: Bry Carling
Topic: 4641  Message: 4641

FOR SALE: Spool of new old stock enamel covered copper wire, excellent condition.

This appears to be pretty old but looks new. Seems to be 20 or 22 awg wire. No micrometer.

Marked "B.D. Land, New York" on the end of spool. Alkso marked: "Dudlo Manufacturing, Ft. Wayne, IN" under the labels. Great for making coils, rewinding transformers and chokes etc.

Spool is about 4.5" tall X 4.5" diameter. Weighs almost 4 lbs. and seems to be a huge roll with many hundreds, if not thousands of feet of wire.

One spool only - available for $20.00 plus shipping.
(or will trade for large quantity of unwanted FT243 crystals)

Thanks for looking and 73 de AF4K, Bry

From: rbethman
Topic: 4644  Message: 4645

Roger,

The only possible "reference" that I can imagine would be the vehicle manufacturing company.

The initial batch of the BC-610s and equipment went into a "Panel Van" or truck, VERY tightly packed, with a trailer towing the generator package.

Most likely Packard had gotten a piece of the contract.

That would mean that "some" of the wiring diagrams would inherently include the vehicle when needed to be included into the drawings.

Hope this makes sense!

That makes even more sense.

I'm just not old enough to know about that "naming".

I've only come across old telephone wiring in the DoE building in Germantown, MD. The conductors were as though someone took round copper wire, and squeezed it into elliptical bands.

They drove us nuts until we began a re-wiring with CAT 5 cable. They wanted to "begin" their "Digital Age".

The old junk would crosstalk a storm when a digital signal was applied.

# 4651. 5 Mc coils?

Yahoo group: T-368_BC-610
Date: 2011-09-12 10:20:11 UTC
From: Roger Basford
Topic: 4651  Message: 4651

Hi All,

I have several PA coils for the BC-610-E covering from 2 to 18 Mc. Yesterday, I was looking through the coils with a view to trying CW on our 5MHz channels, as I have a crystal for 5400kc. I noticed that there are two coils which appear to be physically identical and which have the same number of turns on main and link windings but are marked as for different ranges.

These are:-

51C540 C-398-A 4.5 - 5.7 Mc 24 turns, 2 turn link, no makers info.

51C541 G29163 C-390-A 5.7 - 8.0 Mc 24 turns, 2 turn link, made by B & W.

Now, I tested both coils in the transmitter and found that the C-398-A has the dreaded "perspex-rot" and will need a section of fresh insulation adding under the link, a temporary repair was done. The B & W C-390-A is fine and appears unused.

They both "dip" at exactly the same point on the PA tuning on 5400kc and so I'm wondering why there should be two identical coils for two ranges, instead of just one coil for the range 4.7 - 8.0 Mc?

Roger,

I've accumulated a lot of the PA coils. Usually they do not overlap.

Having said that, the U.S. military also had manufactured a whole bunch of "other" PA coils and Tuning Units. Some were meant for the AM Broadcast band, and even some perhaps lower.

I wouldn't even try to guess as to the "why" and "what" that all of these were meant for.

Bob,

I'd love to have a pick-over of that pile but he'd have to move the decimal point two places to the left! Yes, as rusty '610s go, that is a beauty, could be pristine inside - but I doubt it!

Perhaps he can use the money he gets to buy a keyboard with a full stop and a non-jammed caps lock too.

Hi Bob,

When I get a moment, I will try those coils at each end of their labeled ranges to see if they do cover the same bands. The other thing that occurs to me is that maybe one of them has been made up out of parts from other coils.

That stuff looks pretty rough.

I do not think he is going to get $25,000 for it. But, stranger things have happened. IF it does sell, no doubt it will rise from the ashes to sail on EBay again, albeit in smaller pieces. No Rust of course.

E model.
Serial # 166
Order no 2232-phila-45-07
by General Transformer Corp. Chicago, Ill.

front panel is in 9 of 10 condition. a couple of minor (small) paint scruffs
schematis is attached to the bottom and in good shape. completely readable with penciled notes (light)

top of case seems to be the most scuffed up - probably from stuff stored on it.even has a dust-cap for the socket on the right side.

I've not opened it, but peering thru the slots, all tubes appear to be in place.

Pictures on request.

offering here first before it goes to e-pay.

make offer. add shipping from 77032

73 = Best Regards,
-Geoff/W5OMR

no cables, btw.
I should add that while the top is the most scruffed, it's still mostly (90%) original black wrinkle finish paint.

From: rostaman6723
Topic: 4662  Message: 4662

I have a BC-610-F for sale that was a project to be restored. This project was never completed and I don't think it will ever be.
It is a BC-610-F by David Borgen,Inc. out of the Big Apple.
Order # 10970-PH-4877 Ser#119.
There two tubes MIA the pair of 5933's. I should have at lease one some wear. I might have an extra 100TH brand "X". Will have to look.
All other tubes are there. HV vacume cap and clamps are also MIA.
These Tuning units / Coils are with the transmitter.
TU-47 2-2.5 Mc C-387-D 2-3.5 Mc
TU-49 2-4 Mc C-388-C 3.5-4.5 Mc
TU-50 4-5 Mc C-389-C 4.5-5.7 Mc
TU-51 5-6.3 Mc C-390-C 5.7-8 Mc
TU-52 6.3-8 Mc One coil unknow frq, Home Brew, small windings.
TU-54 14-18 Mc
$650 or best offer for the whole 9
Transmitter is located in Southern, Connecticut. Fifty miles Northeast of the Big Apple.
Jpg's per request.

Maybe he just mixed up the selling price and his
crating fee listed in the description. Should be
$200 for the junk and $22K to pack.

I really like this line; "I AM SURE A GUY WHO
KNEW ABOUT THIS STUFF COULD REFURBISHED 4 OR 5
PIECES AND GET THE INVESTMENT VALUE BACK AND THE
REST WOULD BE FREE OR PROFIT. " Still trying to
figure out which 4 or 5 pieces he is referring to. lol

Not sound morbid, but hope I have some advanced notice when my time comes near. I have some good boatanchors plus a lot of junque to keep them in operation. I estimate that for every 100 lbs of good boatanchors, I have about 500 lbs of junque. I think I have It figured out, so the xyl won't be burdened. I'll have a yard sale and palletize a good boatanchor at an irresistible price along with a pile of parts. The buyer must buy the entire pallet. If not, the stuff will have to be bulldozed into a pit. I hope it all goes to a good home. I feel the population of hollow state connoisseurs might be diminishing.

I just moved a couple loads from up north this past summer and left at least 1000 lbs behind for scrap. Mostly old test equipment, but also a homebrew 4-400 rack rig, HV power supply for a 813 rig and some WWII tower gear. Couldn't bring it all, and none of it was irreplaceable or even terribly desirable.

Part of the problem was that I fell into some similar deals as you're describing, Steve. I have an old friend who is a retired BC engineer who used to clear out his garage and barn from time to time. He'd set out a few things he knew I wanted, offer them to me for $25 or so, then say "but ya gotta take all that too" pointing at the pile. I fell for it a couple times, not a problem if you can deal with the other junk sooner instead of later. Otherwise it piles up on you. Living in a 19 room house with a 2 story carriage barn didn't help. It was great for a packrat, until it was time to move. Found stuff I didn't even know I had, along with a lot of stuff I thought was already gone. Now it is.

There is definitely not the demand following us that has followed previous generations. I turned 50 this year, and I'm considered one of the young guys. Was mentioning to the wife who is a school principal how kids today don't know what radio is. She advised me that many don't even know what a compact disc is. That really put things in perspective for me.

Been selling and giving stuff away for 5+ years now, still a lot to go to get down to just the stuff I want to keep and use. After I'm gone, I don't think I'll care much what happens to the rest.

A few of you expressed interest in the BC-614-E and I've sent pictures.
To date, I've not gotten any reply.
I also don't get a good feeling when I send email with picture attachments from my smart-alec phone.

Those that wrote me, would you please at least acknowledge receipt of pictures, if you got 'em, or if you haven't, let me know that, too.

Thanks!

Hi All,

Just a follow-up to this post. I tried various crystals in the range covered by the two coils mentioned and was able to get a "dip" in PA current at identical settings of the tuning capacitor on both coils. So it looks as though one coil is just incorrectly labeled.

Whilst I was testing I noticed that PA drive was intermittent and wisps of smoke were coming from the TU-50 that was plugged in. This isn't a TU I would normally ever use, as it covers 4 to 5 Mc, and I don't think I'd ever used it since I bought the TX.

On closer examination, I found that the knob used on the intermediate amplifier tuning capacitor has a brass insert that fills about 50% of the rear face of the knob. The smoke was from B+ occasionally arcing across to the front panel of the TU at three points from the insert and carbonising the plastic of the knob. A check of the circuit diagram confirms that the movable vanes of the capacitor are at B+ potential.

The knob can be slid out on the capacitor shaft so that there is a good air-gap between the insert and ground but I swapped the knob for another Hallicrafters type with a smaller insert.

Might be worth checking your TUs and making sure that the knobs have good clearance and that there are no burn tracks or cracking, either of which could make your eyes water!

It should be fairly simple to look inside both and see if the coils look the same size.

First, the PA coils absolutely do NOT need to be "opened".

Second, the Tuning Unit in question doesn't need to be opened to look at the coils.

The "specific" problem is a problem in either the original design, which indeed is the case, as ALL tuning Units have their oscillator associated tube plate's B+ on them.

The problem is the piece of brass in his case.

I have all the TUs that normally shipped with a BC-610. They cover from 2Mc through 18Mc. Normally one wouldn't even think of putting that particular one in the radio, as it isn't a frequency segment allocated in the U.S. That being said, Roger was "looking into" the possible use of the BC-610 on *THEIR* 5 MC segment in the UK.

This is when he discovered the issue of that one specific Tuning Unit. It has an "abnormal" sized piece of brass that arced off and on to the case.

If you don't own one of these, you can't possibly visualize the issue, nor the design.

Hi Bob,

I have put a photo on the web site (in the G3VKM directory) showing a close-up of the knob which flashed over and the type I replaced it with. You can see the three burn-marks at the top of the left hand knob. The only thing "different" about the TU-50 that had the problem, is that it is only TU I own that is actually marked Hallicrafters, the others are just general military versions. As you say, all TUs have the B+ on the capacitor shaft.

I checked seven TUs here, selected at random, and three had brass and four didn't. There are also three as-new TU-52s made by an Italian company post-WWII and they all have the knobs with the small insert.
Anyway, it's a point to watch if people are using TUs that have had rough handling, etc.

Ref 5 Megs; we have seven fixed channels at the moment, no wide band modes like AM are allowed, but at least two European countries have allocated 5260-5450kc on a secondary basis and we are hopeful of getting a similar "chunk" soon in the UK. CW is allowed, and I have had my TCS pair on 5260kc and got some good reports on it. Will have to run the BC-610 on tune power to comply with the regulations!

I started to comment before that I thought someone had replaced the base
bar with one off of the higher freq coil. But I couldn't recall for sure
where in the coil list the switch from airdux to tubing came.

I can only go by the ones that I have. They are indeed a mixed bag of manufacturers. The last one that is wire coiled, appears to be C-447-B, 8.0 - 11.0MC. It is made by EF Johnson. The C-449-B, 14.0 - 18.0MC, I have is a B&W, and it is either tubing or *very* large conductor whose ends are flattened at the connection points.

I've got another C-449-B, it is for the same frequency range, and it definitely is tubing for the coil.

This is a case of whom made the coils under contract, and how they used different materials to get the job done.

Hi both,

The coils I mentioned in the first post are enameled wire types. I think the lowest I have with tubing is 11 Mc but will check.

There's no obvious work been done on the bases of my two coils, but Robert's conclusion is as mine, looks like the base bar has been swapped on one at some time. Do either of you have the same two coils and if so could you compare them with my description?

Roger,

FWIW, my 4.5 to 5.7 MC coil (#1737, 51C709, C-389-C) has 17 total turns with a 4 total turn variable loop. My 5.7 to 8.0 MC coil (#1738, 51C709, C-390-C) has 14 total turns with a 4 total turn variable loop!

Hope this helps,

de Frank, W9FM, owner/operator of a BC-610F

Roger,

The enameled wire type that covers 4.5 - 5.7 MC is labeled as C-389-C.
I've got two of them.

It would seem that Robert Downs idea that the "jack bar" being swapped
at some point is a reasonable assumption.

One of mine is so cruddy, that I'd never use it,, even if the US were to
get that segment.

Bob - N0DGN

Hi Frank & Bob,

OK, well there seems to be a big variation in types of PA coil, I've just dug out one that was boxed by British Army stores in the 60s and that is marked 51A441 and 5.7 to 8.0 Mc. It has 18 turns and a four turn fixed loop. Even in a sealed box the perspex spacers have deteriorated and distorted and they will need some re-cementing.

I don't have many coils with variable loops so I can't make a comparison with Frank's. But,looking at one of the coils I mentioned in the first post, I can see that someone has been at the screws that hold the stand-off insulators, the slots are chewed-up quite badly and that probably means that coil has had the jack-bar swapped at some point and I think that accounts for two identical coils with two different ranges on the jack-bar.

The coils originally supplied with the SCR-299-A through about -C and the early SCR-399-A's all had fixed links, as the only antennas supplied were the fixed whip or the 25 to 40 foot end-fed wire. They all required either BC-729 or BC-939 for loading adjustments. All of the original coils have no letter suffix. Some fixed link coils also have suffix -A or even -B, indicating early modifications, I guess. Some suffix -A or -B have variable links. When the doublet antenna kits came out, they included two sets of rotary link coils. The variable link coil nomenclatures were revved up to the next letter, whatever it was.

From: Bry Carling
Topic: 4679  Message: 4679

FS: Several older, original WW2 - 1950s era ham band FT243 crystals in the
old popular brands: Bliley, JK, PR, JAN, Monwatt, MP, Standard Piezo, Quartz Prod. etc.

1896.5, 1940, 1955, 1977.5, 3701, 3740 kHz

7000, 7006, 7125, 7140, 7150, 7152, 7174, 7175 kHz
7190, 7194, 7200, 7207, 7209, 7225, 7238, 7249 kHz

8375, 8400, 8425 kHz

Most of these I have one each, and a few I have two or three available.
Inquire. These are available for $14.00 each plus shipping.

73 & thanks for looking,

Bry, AF4K

Hello Peter,

Alan's suggestion to contact VMARS is OK but if you are not a member then you can't post to the VMARS Yahoo group.

One suggestion I have is to look at this web site:-

http://www.aade.com/hampedia/prices2.htm

This site shows prices reached in ebay auctions in the US, so they may not be really relevant to European auctions or sales. I am not sure how up to date it is, but the site has been around for some years.

However, the site does show the relative value of a radio compared with others and also how a particular radio is rated by collectors. The 75A4 and R-390 are high end radios, a R-390 would probably fetch about 3-400 GB pounds here but of course they are rare here when compared to numbers in the US. Anyway, I hope the site helps you.

I had a similar fright with my BC-610, 866 flashing-over and so I changed to a pair of 3B28s and they seem to be happy. Did you ever buy that T-1509? :-))

Hello,concerning the 866's in the BC610 I see no reason for changing to 3B28 or so,if the tubes are warm enough,they do a nice job.I cannot move this elephant baby every day.and as to the T1509 I forgot to contact the owner this summer,but I can try next week to come into contact.I am not sure to become a T1509 owner,this transmitter weights double of a BC610 for abt 300wtts,I can let it only groundfloor although my shack is under the roof,I am afraid that my lovely home may collaps under this weight.Sometimes I think the best place for it is a museum.Is there eventually interest from GB OMs?
Concerning the gear mentioned in "subject" there is practically no market in Germany,they are extremly rare,so no up to date prices from foreign countries are not helpful at all.All this apparatus from this old man are in extraordinary good condition,and I am only a little bit acquainted with him,so he gave me time till friday next week.So thank you for your attention and response,will tell you what's going on.

The only reason I ever did the change in some of my earlier rigs was that the 3B28s just LOOKED so darn cool!

YMMV - you probably can't see them inside a '368 or '610 anyway!

These were a separate trailer system. They produced 5KW.

They were never put on the surplus market that I and others know of.

No, both it and the AM-35/MRC-1 were Class C only. In order to operate the AN/MRC-2 on AM, you disconnected the BC-610 and the antenna from the AM-141, connected the BC-610 to the antenna, and used only it.

It indeed IS a linear amplifier.

It is NOT Class C

Ten or fifteen years ago, there was one north of OK City. I supplied a replacement set of tanks coils (his originals burned in a storage shed fire). Seems like the guy's nickname was "Curly" or something short and similar. Haven't heard from him since then. AFAIK, he only had the AM-141.

The entire AN/MRC-2 was in three HO-17's and took four Deuce-and-a-halfs to move, three for the HO-17's and the fourth for the antennas, spare PE-95, and probably crew belongings. The three shelters were Transmitting, Receiving, and Operating. Had three PE-95's in trailers (plus a fourth spare not in trailer). It was considered semi-fixed. Included the AN/TRA-7 for FSK. And the modified master-slave BC-342's for receiving. Used two of the HF doublet antennas (the ones that eventually became AN/GRA-4). Replaced AN/MRC-1.

It had to be magnificent. I remember visiting the station of Don Hoisington in Alabama. "Hoisy" had built his own QRO AM transmitting equipment.... mostly sitting on the floor or in wooden project frames made out of chicken wire and 1" X 1" wood frames.

I do remember that the transformers sat on the floor. Pairs of 833As "super-modulated" by Pairs of 810s or 833As.... big iron, and sure to energize the ether most evenings after 10 pm when the neighbors had all stopped watching TV and gone to bed!

Bill - The designation is REALLY a misnomer. It is an antenna coupler. It takes a 50 ohm input, and by use of ONLY inductors, with the exception of specific coverage, it is intended for the Military Whip antenna, OR specifically listed *long Wires*, which are ANYTHING but!

Look up the antenna unit in the BC-610 manual.

It does NOT play well with transmitters other than the BC-610.

There is a somewhat similar one for the T-368.

Bob - N0DGN

It was designed to feed a very short mobile vertical (AN/GRC-26D) and not much else. It allegedly could tune a long wire, but never tried it when we used the T-368 overseas. More modern tuners have a more suitable range for "normal" ham applications. In the signal corps fixed station installations we never used the tuner as was virtually useless due to it's limited matching range on land based antennas. The only purpose it's really is good for is a door stop or for parts. You're better off with a used EFJ tuner (the 250 watt version or the KW beast). That was my army experience with the T-368.

It doesn't work with the kinds of antennas that Hams normally use.
Ditto the T-368 version.

First, BC-939-A or -B was not designed for and not generally used with the AN/GRC-26D. Although a few might have been used with the D model, that would have been only because someone had screwed up and failed to do the MWO. The antenna tuner used with AN/GRC-26D is TN-339/GR. The BC-939-A was originally built for SCR-39-A9 and SCR-499-A and retro-fitted to some dismounted SCR-299-(*) after 1942. It was carried over when SCR-399-B was renomenclatured AN/GRC-26 circa 1950.

Second, the BC-939 was not built to match ANY long wire antenna. By definition, a "long wire" is an end fed wire more than half a wavelength long. The TN-339, BC-939 and it's predecessor the BC-729 would match an end fed antenna between the lengths of about 15 and 60 feet in length from 1 to 18 MC (2 to 8 MC for BC-729). Which is what was generally available to mobile units. 15 foot whip while in motion. 24 foot whip or 30 to 60 foot end fed wire at a temporary halt. When dismounted and used as a temporary fixed station (wherein by definition it became SCR-499-A/B), the antenna normally used was a three-pole supported doublet which had several different nomenclatures over the decades.

"Normal" ham applications don't need an antenna tuner. You buy a pre-made Jap antenna, put it up, and if it doesn't work you call someone born before 1960 to come fix it for you.

If it doesn't work, try a capacitor, in series with the antenna. That will make it look shorter. I'd try an air or vacuum variable, with suitable spacing. 250-500 pf might be a good starting point.

Hi All,

There was a series of articles on the BC-610, etc in Electric Radio a few years ago, by N6PL I think, and there was a section on simple modifications to use the BC-939 on the LF bands. IIRC, a vacuum variable capacitor was the main addition, as Ray says. The author did send me the PDFs of the articles if anyone has a problem finding them.

Tom,

The "mod" to use the BC-939(*) on LF is in TM 11-826, starting on page 43.

The vacuum caps are the MAIN change. There is ONE wire added.

The other change is on the PA deck of the transmitter. This MUST only
be used for the 160 range of operations! It MUST be removed for
operation above this range or damage will be done!

The instructions for modification of the BC-610 are also in TM 11-280
Change 1, 08 September 1944, in the section on Frequency Conversion Kit MC-509.
The antenna tuner mods apply specifically to the BC-729. I'm pretty sure
that the ones applying to BC-939 are in one of the changes or supplements to
TM 11-281, but I don't have them handy to look at right now.

The MC-509 is Chapter 4 of TM 11-826.

It specifically covers the BC-939(*), and the RF deck mod for the
resistor and choke.

Topic: 4686  Message: 4712

Sorry, but as I wrote earlier from memory, that is not correct. It indeed IS NOT a linear amplifier. TM 11-624 dated 18 December 1953 page 218, "Section IV. THEORY OF AMPLIFIER AM-141(*)/MRC", paragraph 149. "General", second sentence, reads as follows:

"The r-f section is a class C r-f amplifier using two type 833A triodes connected in push-pull."

Several sentences on, it reads:

"A bias power supply provides the proper negative voltage for operating the amplifier as class C."

Any web sites saying that AM-141 is a linear are repeating urban myth.

Are you going to make the NUMEROUS TMs available for download?

TMs not readily available to look at make it a moot point.

Since no one but you seem to have them.

Nope. Major philanthropy is great, when you can afford it. I can't.
Selling a few manuals is one of many ways we've managed to mostly keep the bills
paid through 13 years of unemployment. Which isn't to say that I don't
often send someone a schematic or similar if that's all that they need and no
one else already did. Besides, I was quoting from an original. I've never
scanned TM 11-624.

That showed up on another list this morning. Supposedly, there should (in a complete unit) be another T-368. And the one receiver included should be an R-390 or R-390A instead of a civilian SP-600. However, it would be an interesting set.

hello guys , at last ! the BC610 is now firing on all cylinders. the RF choke which roger G3VKM put me on to did the trick . i lost the nut on the tank coil centre tap when i removed the connection from the choke, but managed to find a fixing ring from an old switch which had the same thread and was thin enough. unfortunately a couple of the main screw in fuses went at the time, so i am down to my last 3 .
all i have to do now is to put up an antenna. i have decided to use my 38 ft bantex vertical mounted on the roof of the tank shed just over where the truck is parked . that should match ok with the BC939 . i have a spare RF choke , as i got 2 . if anyone is desperate for one , let me know. cheers, alan G4GEN

R-390 folk,

Luckily, AVG nailed it and blocked the malware install.  Others may not be as lucky.  Might oughta check this out.

Generally (but not always), what this means is that Mr. Young's computer is infected, and the virus is attempting to spread itself using entries in his email address book.

If anyone clicked on this URL (less the X)

http://omniscalaX.home.pl/viton.php

and your anti-virus didn't catch it, you're probably infected as well.

If that's the case, I suggest that you Google "housecall" (one word) and run the know safe, free test at Trend Micro to see what's up.

Good luck, and

73,

Mike, WB5MYY

From: Roger Basford
Topic: 4717  Message: 4720

Hi Alan,

Glad to hear the '610 is sorted. I may have some spare fuses, as a group member very kindly sent me a box or two a few years ago. I'm in Norway at the moment but will be home next week, so will have a look then.

I'd be careful to check if that Bantex whip is just a straight element, as some of the marine types I used to work on had a helical construction in the lower part of the whip, that provided a loading coil effect. I've a feeling that I still have a Bantex catalogue stashed somewhere which gives the details.

hello roger, thanks for the offer. i must get a box of them myself . the bantex whip is fairly hefty. it is made of a sort of translucent material , and is about 2 " in diameter at the bottom . it looks like a straight conductor inside. there is a large porcelain insulator for the base which it screws into. also have the plate for attatching guys 2/3 up. my son has to replace a cracked asbestos sheet on the roof, so they will be up there anyway. cheers, alan

hello guys , well , when i said that the BC610 was going ok , i was not quite correct. when i fixed up an antenna i soon found out. the dip in the plate current is in the wrong place on the dial and much too deep. it drops to around 30 ma . nothing which is done to the coupling or the BC939 makes any difference.the exciter is fine and on the right frequency. i have tried both 40 and 80 and it is the same. i have a nasty feeling that the 250 TH has been damaged . any ideas ? alan G4GEN

My guess is what all you did in the PA, not to mention the "funny"
peculiar mod to use the whip that far away from the 939.

hello , well i have not done any mods to the BC939. all i was using was a 15 ft bit of wire to test the BC610 . i would never mod any www stuff. looking at the problems , i do not think we will be able to mount the whip on the roof. i will just put a feed through in the roof above the truck and use a long wire. 250THs cost a lot of money ! i have a spare somewhere though.i will try it tomorrow. cheers, alan

Alan,

Are you sure that the antenna shorting relay is opening when you go to transmit? I had exactly the same issue with mine and that gave me a very deep dip and no output.

FOR SALE:

1000 watt Isolation Transformer. for 120V AC.

by Northlake Engineering Co. This is a 1:1 transformer.
120V AC in = 120V AC out. Very conservatively rated.
Actually is rated for 12 Amps (1400 watts.)

Has four IEC outlets and heavy duty power cable.
Heavy gauge, light gray metal case with rubber feet.
Like new condition. Supplied with cables.

Has a nice breaker switch for power ON/OFF.

Available for $45.00 plus shipping

Yes, but it doesn't significantly change the position of the capacitor at
the dip. I'm not sure what shorting the output would do in that regard.

Would act like a shorted turn(s) and lower the inductance of the tank circuit. How much would depend on the number of turns in the link and the tightness of the coupling to the tank coil.

Hi Alan,

Glad it's OK now. The connecting wires to the relay coil run down to the two-way terminal strip on the rear right hand corner of the modulator deck; on my '610 the connection had become tarnished and wan't making good contact. The power to that tag-strip comes from the main breaker on the rear left of the mod deck, that had a dirty contact too.

The other thing about that relay, which we discussed on here recently, is that the version I have doesn't like 50Hz AC, it buzzes really loudly. I found that I could insert a bridge rectifier and a smoothing capacitor in the supply line and the relay would close OK on DC with no buzz. However, the relay is an AC model so I don't know if I might eventually harm it by that modificaction. If it has an O/C coil it should be easy to rewind, or swap the coil from another relay and improvse a suitable DC supply.

The problem with using dc on an ac relay is that
excessive current might damage (overheat) the
coil as the coil current limiting inductance does
not come into play on dc as it would on ac. If
there is room on the relay iron core you may be
able limit or eliminate the 50 hz buzz by adding
an additional shorted turn of heavy copper wire
which will delay armature movement. There should
already be a copper "shading" turn in place on the relay.

A copper coin or copper piece with a hole cut in
the center that would fit over the core might also work.

Alan,

You might consider eliminating RY-4 altogether. It's only there to:
"eliminate absorption at the frequency of the transmitter that might
cause an apparent decrease in receiver sensitivity at that
frequency." (TM 11-280, June 1943).

From: Alan Morriss
Topic: 4735  Message: 4735

hello mac , that was my intention. it is not doing anything now as it is only connected to one side of the output link . i took off the easy to get at one ! i do not see what i can do now. instead of the dip being relatively shallow and around 30 on the dial, it is deep and around 60 . disconnecting the 939 and removing the tank coil gives infinity on a meter across the antenna terminals. so there is no short . what baffles me is that it worked yesterday with the correct dip. the PA grid current is around 100 ma which is ok .
on another tack , the new 250 TH has a much larger top cap than the old one , and has a brass adaptor to fit the clip . it looks rather splendid and gleaming . however it made no difference whatsoever. no doubt the solution will pop up some time. alan

Alan,

OK, back down to 60 (more capacity needed to resonate), that would indicate a shorted link again. First thing I would do is disconnect the 939 at the transmitter and see where the dip comes comes in. If somewhere around 30 you have a problem in the tuner or the cable going to it. If, on the other hand, the dip is still at 60 the problem would seem to be somewhere on the tank coil assembly itself.

HAng on, Alan... You said you had RF out of it, when you forced open (or closed, I dont remember) the relay, right? IT's not the cause of anything connected to the antenna... you're not getting RF out of the link. Check the connections on the jack-bar that the coil plugs into. Check the link - make sure both sides are connected. Trace the wires from the jack-bar to the antenna terminals. Address and check whatever is in between, then make sure the connections to the antenna terminals are spot-on.

The final is dipping so low (I never pay attention to -where- ... variations on load/antenna will make that final load in different positions) because it doesn't have a load on it. It's acting as if there's no antenna connected.

73 = Best Regards,
-Geoff/W5OMR

hello geoff , yes , it was fine , and the dip was in the right spot on the dial. i had just jammed the relay open with a bit of wood. next day i did a proper job with a strip of paxolin between the contacts of the relay, and it has never worked since. i have disconnected the lead from the output link to the relay , and it still is the same. as you say it is performing as if no antenna was connected. it has to be something unbelievably simple. i want to keep the relay, as we use it mostly with the whip antennas . cheers, alan

hello , i canot find the wattage of R9 the shunt resistor for the RF choke. all i can find is the value which is 700 ohms. does anyone know ? i am going to try one which i have which is about 2 watts.cheers, alan

According to TM 11-281, page 5.

R9 is 20 Watts.

Odd that they used a wire-wound resistor in that application? I may be able to help, Alan if you get stuck. Have a large junk box with a few 100 w/w resistors but you may have to use more than one item to get the right value, which I doubt is critical.

My SCR-299 manual (TM 11-280, 22 June 43) lists R9 as 700 ohms, 20W, type X1022 which could have been a non-inductive unit. R9 is also identified as a "parasitic suppressor" in the text (page 63). Several other 20 w units listed but none with that type identifier. The transmitter might operate OK without it. The plate circuit for the BC-610 is standard for the period and I have not seen a resistor placed thus in any of the various handbooks and texts in my library. Note that the BC-610 was intended to operate over a wide frequency range. The resister may have been found to be required to suppress a parasitic or other instability at some frequency(s) and/or operating conditions and maybe only with some units but all got the treatment to be safe. My surmise anyway...

From: Roger Basford
Topic: 4741  Message: 4750

Hi Dennis,

Just had a look at R9 in my rig (by shining a torch through the side louvers) and it would appear to be a standard wire-wound type. I can see it might have been fitted to swamp any spurii generated by the choke.

I still think Alan's "deep-dip" problem is related to the output link circuit or beyond that point.

hello , i am starting to think that what is happening is parasitic oscillation and that the dip is coming at a point which is a resultant of the two . this would explain it . later i am going to try the resistor . i have just soldered a couple of crocodile clips on the leads so i can put it straight across the choke. if this does not work , heaven knows what to try next. it was working perfectly before , and all that has changed is the type of choke . alan

hello roger, i do not see how it can be. all connections are fine. with the tank coil removed the resistance measured from the BC939 end of the connector is infinity. with the coil in it is zero . the 939 itself is fine . resistance measured from the link sockets with it connected is also about zero. it was fine before the incident and working well. nothing has been done. i will let you know what the result is with the resistor in place. if you can find a wirewound R9 , that would be great . cheers, alan

hello geoff , i checked all resistances , and it is near enough zero from both jackbar sockets to the output terminals. fitting the coax connector, it is zero to the 939 end from the appropriate jackbar socket. between them it is infinity . connecting the 939, between the jackbar sockets resistance is almost zero . there is nothing wrong there .nothing has been changed except fitting the replacement choke. as i said , before the old one failed the 610 was going really well .the new choke is of a different design to the old one . it has 6 thin sections instead of the 4 in the old one. that had 2 thin outers and 2 thick inners . maybe the new choke has a much higher Q . i am going to try and find a 700 ohm 20 w wirewound resistor tomorrow. alan

Alan,

That seems a bit low to me. I've just checked my rig and get 450-460ma off-resonance. I could probably go a little higher but that would trip the overload relay and I try to avoid that. I get 280ma on resonance on CW into a Marconi 75 Ohm dummy load, but my mains supply is a a little low at 110V. If you have any of the old filament light bulbs try a pair of 100W. I use a single 200W bulb and get full brilliance.

Alan,

Have you gone through the whole transmitter and checked ALL of the grounding points, including the tube sockets???

The cause of your parasitic oscillations may need to be drained off to ground somewhere.

Joe

Hi Alan,

I don't think the choke construction should be too critical as long as it's about the right value and can handle the through current OK. Did you say in an earlier that R9 is actually missing? I can see that might give issues if it's not there.

Pity you're so far away, otherwise I'd come over and lend a hand. Of course you could always drive the deuce-and-a-half over here, although my neighbours would no doubt not react too likely to an SCR-399 outside!

How is the grid current at the new dip compared to before? I haven't looked in that part of a 610-E recently and forget how the wires are physically run versus how they are drawn on the schematic. But check that the HVDC lead goes to the tuning capacitor end of the choke you replaced and not to the coil end. And did you transfer the 700 ohm resistor from the old choke to the new one?

funny thing roger , but that occurred to me last night, and i decided to check it by removing the tank coil and putting a meter across the output terminals . that should indicate it if i then go to transmit.. cheers, alan

This is a frequent problem with Yahoogroups.

I have seen them deliver messages to these groups up to 3 or 4 weeks later sometimes!
The explanation has been that it is with groups that are less active. I don't see that to be
the case here at all. I guess Yahoo just uses software that isn't written very well!

# 4770. problem

Yahoo group: T-368_BC-610
Date: 2011-11-02 19:46:15 UTC
From: Alan Morriss
Topic: 4722  Message: 4770

hello everybody . oh well , the resistor made no difference at all. the off resonance current in high voltage protect is 250 ma. this choke is never going to work . so ray , i would like to take you up on your offer ! i can send the two ones which i bought on ebay as replacements. they are new and nice ones.l i think that they may be for a T 368 . on top of that whilst i was crouching behind the tx in the shelter i lost my balance and knocked the grid connection and glass off a 100TH. not my day. cheers, alan

From: Alan Morriss
Topic: 4730  Message: 4771

thanks roger. for the time being i am going to put a strip of paxolin between the contacts. i will check the coil for continuity this morning, and if that is ok will investigate the supply. i am fairly convinced that the relay failing was what took out the choke . alan

Alan,

Before you let the chokes go, try a jumper across the choke and see what current is drawn, it may be that something else (in the power supply?) is limiting.

From: Alan Morriss
Topic: 4722  Message: 4774

hello roger, well , the plate current is the same as it always was. as regards the rf drive,wayne, the PA grid current is fine , and everything is the same as before except the dip . if i can get a choke the same as the original , we will see. this one looks totally different, but the mounting etc. is the same. i could try a jumper , so next time i work on it i will sse what the current is.i am now using the xenon rectifiers . cheers, alan

# 4775. fault

Yahoo group: T-368_BC-610
Date: 2011-11-03 11:29:27 UTC
From: Alan Morriss
Topic: 3174  Message: 4775

hello roger, well , it looks as if you have hit the nail on the head. i removed R9 , and shorted out the choke . no change, all readings were absolutely the same. the jumper was removed with no R9 and still the same.removing the jumper and replacing R9 made no difference. all connections are correct. one end of the choke goes to the stator of the capacitor at the same end as the B+ feed . the other goes to the centre tap of the tank coil and C11 . all the original leads are used.
it seems to me that the choke must be of far too low a value . all i need to do is find the correct one ! until i do the shelter will be left closed. no more groping in the dark.
cheers, alan

From: Roger Basford
Topic: 3174  Message: 4776

Sorry Alan,

I don't see your reasoning there, if the choke is out of circuit and the PA current is still low off-resonance then the fault must be elsewhere than the choke, surely? By that logic, even if the choke were of a completely wrong value then it would still pass current OK. So, I don't see how you arrived at the conclusion.

According to the circuit in TM11-218 page 17, the choke is connected to the ROTORs of the two PA tuning capacitors and B+ is connected there too. The other end goes to the PA coil centre-tap.

Hi Alan,

About 450ma, it will go higher but that will trip the overload relay, same rectifiers here. 250ma is far too low.

Roger,

I think Alan's 250 mA figure is with the heating element switched in series with the HV transformer primary.

I still say the final is acting like there's no load on it.
Pull the tuner off of the output terminals, and try again. Results will probably be the same.
Replace the tuner with 2 or 3 100w bulbs, or a single 500w flood lamp as the load. If there's no difference, the the Rf isn't getting coupled at the link. Check the link wires. Check the connections to the output terminals.

Because there is plate current, there MUST be B+.

From: Alan Morriss
Topic: 3200  Message: 4782

Hi , well , it does not matter what you do to it. i have put a light bulb across the output. nothing. the choke has been shorted out, still exactly the same dip and in the same spot on the dial. R9 in place or not , still the same. i think that the choke value must be too low and the RF is bleeding away .incidentally , when i said the connection was to the stator, that was just what it looked like. it is actually the rotor. i have never allowed the plate current to exceed 300 ma except for a brief moment , because that is what it says in the manual as a max for CW operation . except for thie problem , everything is fine , and i am sure that if i could get hold of a proper choke all would be ok. actually it is driving me mad ! cheers, alan

# 4783. BC-610 output problem

Yahoo group: T-368_BC-610
Date: 2011-11-04 09:45:53 UTC
From: Roger Basford
Topic: 3200  Message: 4783

OK Alan,

Firstly, I missed were you said you were running in high voltage protect, so the 250ma max off-tune current is probably right, so belay my last.

Secondly, if you are getting a dip, albeit a very deep one, then the PA stage should be getting drive and passing current, so whether or not the choke is in circuit may not be relevant to the problem, IMO.

You say the drive is OK; have you tried tuning for the PA dip and then removing the crystal from the TU? This should show if the PA is amplifying OK and that the PA is not taking-off when drive is lost, which might indicate a choke problem. What does the signal sound like on a local RX? Any instability or distortion might indicate that the PA is oscillating and you might need to neutralise it again to compensate for circuit chnages.

I've rather lost the thread on this subject as the titles keep changing and Yahoo keeps delivering old posts just to confuse things all the more! Did you say that this problem is on all frequencies, or just on 80m?

Hi Alan,

Just done another check here. With no antenna connected to my '610, I get a dip to about 45-50ma on HV protect and about 60-65 ma on full power. The rig has a standard output circuit and a swinging-link PA coil. Tests done on 3615kc.

Topic: 4784  Message: 4788

If I remember correctly the original problem was that the dip was occurring at the wrong dial setting for PA tune. Then when the failed antenna relay was blocked open it occurred at the correct (book) setting. Then, Alan did some internal work and the dip came up at the wrong dial setting again. Is this still the problem? Or is it something about the depth of the dip? Or something else? I've lost track,,,, :^(

Date: 2011-11-04 16:58:12 UTC
From: Alan Morriss
Topic: 3174  Message: 4789

hello dennis, well , what happened was that the antenna relay was not operating, so i jammed it open with a bit of wood. all seemed fine then , and i went to bed happy. next day i did a better job with a strip of paxolin , but it was back to square 1 . i then disconnected the relay completely , but no dice. a meter across the antenna link terminals with the coil removed and the 939 also disconnected gives infinity . connecting up the 939 gives zero as it should be. across the antenna terminals with the 939 disconnected and the coil in place also gives zero .
i think that the result i got the first time was a fluke . the problem may be parasitic oscillation , and it did not do it just then . if i cannot get a proper replacement choke i will fit one from a british transmitter no 53 . this replaced the BC610 in the british army . the choke is a lot bigger though. cheers, alan

From: Roger Basford
Topic: 3174  Message: 4791

Hi Mark,

When I got my BC-610-E a few years ago it had a -D plate. I managed to find an -E plate on ebay, amongst a box of bits and pieces including the bowl fire element and the main contactor.

Anyway, I digress; there is an ebayer, I think in Italy, who occasionally pops up selling BC-611 plates and I was about to ask him if he'd consider making a '610 plate when I found the one mentioned above. It's a long shot, but worth an e-mail if you can find him. A "BC-611" search would likely show him up.

Alternatively, if a BC-610-D plate is of use to you, I can see if I can find the one I took off. Have a BC-939 plate too, somewhere!

Hi All,

A number of PA coils for the BC-610 have been listed in a SK sale over here. Two of the coils look to be for another TX to me, can anyone identify them? Please see the g3vkm directory in the photos section:-

Hi Bob,

No, me neither. They also appear to have a output coil with a centre tap. I'm hoping that someone can ID them from the box markings.

It has too many turns for either.

The 20M coils has about the same number of turns

Hi Dennis,

I have an original Hallicrafters manual for the post war HT-4I and HT-5I. There's a photo of the transmitter with all the coils and TUs arranged in front. I can't see any extra turns on the link coils shown in the photo. The parts list gives the coils as being in the 51C7** series and there's a couple of handwritten notes mentioning a 10 metre conversion kit.

Roger,

*IF* you should happen to find a 10M TU, be VERY careful.

WB2FCN used to run these on the 2 1/2 ton trucks with the comms enclosure. They found that running them on 10M resulted in having RF crawling all over the BC-610 Chassis.

It did NOT occur when it was mounted outside the comms enclosure.

It was one of the reasons that the U.S. Army stayed away from 10M operation.

Hi Bob,

Yes, I think that's been mentioned on here before but I can't recall who brought it up. To be honest, I've never used my '610 above 3705kc and I have more stable vintage rigs like a DX-60B/HG-10B for Ten.

Alan,

The BC-610 does very well on 160, 60, 40, and 20metres.

There have been other frequency ranges used by the U.S. Military. This includes the AM BCST Band, (540kc through 1600 [it has grown to I believe 1800 over here now.]). The problem is finding these *other* Tuning Units and coils after all these years.

U. S. Army DID run 10 metres successfully - BUT - when dismounted from the truck.

Yes. They also used them in Korea as part of the Armed Forces Radio Network.

However, as I stated earlier, while it *IS* known, I do NOT know of ANY of those TUs or Coils being in hand.

Their disposition would be murky to say the least!

Hi Bob,

A couple of years ago I acquired a pair of (I think) 1 to 2 Mc coil and TU from France, which I've never tried out but I have seen a TU for under 1 Mc on ebay. IIRC, it fetched a good price. "Medium Wave" broadcasting is on the way out in Europe, so maybe we'll get a "slot" in that band below 1.8 Mc someday!

Do you think it would be possible to put a BC-610 on 500kc? We have an allocation around that area which is available on a special variation to our normal licence. I have a pile of junker TUs!

Yes, I believe that it could be run down around 500KC. I just have NO information regarding the coil.

Nor do I know what modification a TU would require to allow it to go down there.

I DO have a coil that will run between 1500 and 2000Kc. I modified a 2MC TU to be able to tune down as low as 1660KC.

This gives me the ability to run between 1800 to 2000KC, thereby getting it on 160metres.

Roger,

The two commonly available tuners and coils cover 1.0-1.5 MC and 1.5-2.0 MC.

We once used a (my) BC-610-F on 770 KC by padding down the 1.0-1.5 units. This was in a carrier current system (uses the AC lines as the distribution system) at Louisiana Tech, either KLPI or WLPI (I can't recall which for certain). The other transmitter in the system was a much modified (most of which happened before we got it) T-47/ART-13. By the time that I came home from Vietnam in late 1968, the two had been replaced by several commercially built carrier current units (one per dormitory). And the 610 went back to the ham bands.

Roger,

No. I thought that I had seen "MI-" numbers used by RCA but I just checked AVT, ATB and SCR-288, respectively Civilian, Navy and Signal Corps, and although I found a lot of "M", there were no "MI".

I've had similar coils in the past, always mixed in with BC-610 ones. Fair radio had some listed maybe 10-15 years ago. I don't recall whether they knew and listed what they were used in. Might be worth pursuing.

OK Robert,

Thanks for your efforts. I will pass on to the auctioneers that the coils may not be BC-610 types. I can't see there being a buying frenzy for them!

look at the photos mc509
i now there was a mw pirat with a bc610 that was below the 1Mc for 20 years ago in the neterlands
i have a tu unit with a dds ,so the tu unit is not the problem
the coil will be the problem

Frequency Conversion Kit MC-508 includes coils, tuning units and padder capacitors to extend the frequency range of the BC-610 down to 1.0 MC.

However, I have a feeling that when I wrote yesterday that we padded down a 1.0-1.5 TU and coil to work on 770 KC, I was maybe correct about the TU but not the coil. The only other thing that I recall is that we got them from Fair Radio. This was probably in late 1966 or early 1967. Unfortunately I don't have any Fair catalogs that old. And although I had the coil and tuning unit probably past 1973 when I moved to Houston, I don't have them today. And apparently got rid of them before the C64 came out (when my current database started).

Just wondering if they are from a T-55? It is similar to a BC-610, somewhere I have a TM for it and if I find the TM,I will check it out.

I am looking for a TM of a T-158 transmitter, (Wilcox 96), I have a TM from a Wilcox 96-200 lf transmitter to trade.
Thanks, George W5GRG, AFA6GG

I suspect a few Wilcox 96 rig's survived the scrap pile? A pair of 450's would sure keep the shack warm in the winter.Wilcox also mfg a smaller xmtr that used a pair of 810'2 in the final. Same concept as the 96 series in that there was a common PS and modulator cabinet, with up to four separate RF cabinets, one for each operating frequency. Either one would have made a great "boat anchor" station if you had the room and man power. Great source of parts.

George,

You may be on to something with the T-55/MRQ-2 (a modified BC-610-E). I don't have the AN/MRQ-2 manual but do have the Repair Manual on the T-55. One top view photo shows a tank coil with an external fixed link. The schematic of the tank coils (no clue to number of turns in the link) shows one end of the link and a tap (not drawn as center-tap) going to the jackbar and a flying lead from the other end of the link going to an external switch, apparently for connection to a rhombic. If you removed the flying lead or tied it off to somewhere safe it appears that the coil would still work in a regular 610 with a BC-939.

Nearest thing I have to your TM search is a manual on T-158C,D/FRT. TM 11-5034. And the manual number (TM 11-2671) but no manual for Wilcox 96A, 96C and 96C-3.

Hi All,

Found the following on the N7JP site:-

JAN Type: AN/MRQ-2
Nomenclature: Radio Set
Reference: TM 11-640
NSN: 2S3004-2
Components: T-55/MRQ-2 Radio Transmitter, BC-939A Antenna Tuning Unit, SCR-808A Radio Set, SA-24/MRQ-2 Antenna Switching Unit, C-110/MRQ-2 Control Box, URA-TI Training Generator, BC-614E Speech Amplifier, BC-342 Radio Receiver, BC-344 Radio Receiver, CU-45/MRQ-2 Antenna Coupling Unit, C-100/MRQ-2 Antenna Control Box, AS-51/MRQ-2 Antenna Assemblies, AS-93/MRQ-2 Antenna Assemblies, PE-95 Power Unit
Weight: 15920
Mode: 6A3, 2A2, 0.1A1
Frequency Range: 0.95-18 MHz
Power Input: 115 VAC 60 Hz
Power Output: CW: 400, MCW/AM: 300 W
Number of Channels: Continuous Tuning and 3 Crystal-Controlled Transmit Channels
Replaced By: TLQ-15
Part of: MRQ-2
Description: The MRQ-2 radio set is a modification of radio set SCR-399-A for use as a radio countermeasures unit. It is mounted in a hut, HO-17-A.

My Wicox 96 came from my friends barn and I only have 1 rf section. I am "planning on" making a linear amplifier out of it since I only have the PA section and not all
of that either. Not sure how the 450TH's will work in linear service but I have an Eimac bulletin with some facts on that tube in that application
I have a old GE power supply that I plan on putting in the bottom of the cabinet., not sure it has enough output but it is a start so I will not be relying on the knob on the bottom to disconnect the rf deck from the remote ps. I guess some guys got shocked when they opened the cabinet to change the tap on the output coil.
I am missing the B+ rf choke so will have to make one of those if I don't have one laying around.
I hope to document the project. I would really like to find a roller for the output coil, someone got those, a picture would do it, I can make one.
Hope someone can find a TM for me, no luck on the net.
Thanks, George W5GRG, AFA6GG

FOR SALE: QTY 32 - New Electrolytic Caps, radial leads.

QTY - Capacitance / DC Voltage

1 - 10 uF / 400V
1 - 33 uF / 350V
13 - 33 uF / 400V
1 - 47uF / 400V
4 - 47 uF / 450V
4 - 82 uF / 400V
2 - 220uF / 400V
3 - 270uF / 200V
2 - 330uF / 63V
1 - 470uF / 63V

Total of 32 new capacitors, great for amateur radio and other electronic applications.

Will sell the whole box for $12.00 plus shipping

73 - Brian, AF4K

# 4826. WTB Cabinet Blower for T-368C

Yahoo group: T-368_BC-610
Date: 2011-11-26 02:43:59 UTC
From: Mark J. Blair
Topic: 4826  Message: 4826

Hi! This is my first post to the group. I have a T-368C which I'm fixing up to put back on the air. My transmitter's original cabinet blower has been replaced by an ancient open-frame fan from Radio Shack and some rotting foam rubber. I understand that for ham use I may be able to get along without the original blower since I won't be doing RTTY 24-7 (though I may do some occasional RTTY with it). Some folks have suggested simply leaving the back cover off, but I don't want to do that for safety reasons: my dogs don't understand electricity. So, I'd prefer to replace the original blower, even if I end up bypassing it with a switch or thermostat to reduce noise. I'm trying to keep my transmitter in a fairly original configuration, though I'm not being 100% strict about that. For example, a previous owner had soldered romex to the power input connector pins, so it had to be replaced. I want a 3-wire grounded line cord, but 3-wire twist-locks are too large to fit in the lower cabinet rail, so replaced the original connector with a cable clamp and hard-wired my new line cord to a 3-terminal barrier strip that I installed inside the cabinet.

Ok, enough rambling... Do any of y'all have an extra cabinet blower assembly lying around that I might buy or trade for?

If I can't get an original blower, I'll probably install a new, high-quality muffin fan. I'm not sure how much air flow I'll need to keep the case at a good temperature. In any case, I might wire in a thermostat or something if I find that the fan makes more noise than is needed to keep the cabinet cool. Wait, there I go rambling again!

Thanks in advance for any leads!

# 4827. Cleaning up silver-plated coils?

Yahoo group: T-368_BC-610
Date: 2011-11-26 05:48:13 UTC
From: Mark J. Blair
Topic: 4827  Message: 4827

[Cross-posted to T-368_BC-610 and Armyradios]

The silver-plated stuff in my T-368C is pretty tarnished. I've been cleaning up the moving contacts, but I'm wondering whether it's better to clean up the coils and straps or just leave them alone. Here's a picture of the big coil in my RF deck:

http://gallery.me.com/nf6x#100063/IMG_1566_2&bgcolor=dkgrey

It's about the dirtiest-looking plated part in my radio. Most of the silver-plated stuff has gray to black tarnish that cleans easily with Tarn-X, but the coil also has lots of bluish spots. I don't know what'll happen if I try cleaning the bluish spots, so I figured I should ask before trying. Are the blue spots areas where the plating is gone and the underlying copper has corroded?

MARK!

How ya' doin?

What truck are you going to put this in?

Don't worry about the noise from a muffin fan it can't possibly be any louder than the original.

READ the notes and such on the website for this list we have a TON of good stuff there including a start-up manual.

Joe KG2CI list owner.

I sold my deuce to someone in Mass.

So, I'd prefer to replace the original blower, even if I end up bypassing it with a switch or thermostat to reduce noise. I'm trying to keep my transmitter in a fairly original configuration, though I'm not being 100% strict about that. For example, a previous owner had soldered romex to the power input connector pins, so it had to be replaced. I want a 3-wire grounded line cord, but 3-wire twist-locks are too large to fit in the lower cabinet rail, so replaced the original connector with a cable clamp and hard-wired my new line cord to a 3-terminal barrier strip that I installed inside the cabinet.

Ok, enough rambling... Do any of y'all have an extra cabinet blower assembly lying around that I might buy or trade for?

If I can't get an original blower, I'll probably install a new, high-quality muffin fan. I'm not sure how much air flow I'll need to keep the case at a good temperature. In any case, I might wire in a thermostat or something if I find that the fan makes more noise than is needed to keep the cabinet cool. Wait, there I go rambling again!

Thanks in advance for any leads!

MARK!

How ya' doin?

What truck are you going to put this in?

Don't worry about the noise from a muffin fan it can't possibly be any
louder than the original.

READ the notes and such on the website for this list we have a TON of good
stuff there including a start-up manual.

Joe KG2CI list owner.

I sold my deuce to someone in Mass.

Hi! This is my first post to the group. I have a T-368C which I'm fixing up
to put back on the air. My transmitter's original cabinet blower has been
replaced by an ancient open-frame fan from Radio Shack and some rotting foam
rubber. I understand that for ham use I may be able to get along without the
original blower since I won't be doing RTTY 24-7 (though I may do some
occasional RTTY with it). Some folks have suggested simply leaving the back
cover off, but I don't want to do that for safety reasons: my dogs don't
understand electricity. So, I'd prefer to replace the original blower, even
if I end up bypassing it with a switch or thermostat to reduce noise. I'm
trying to keep my transmitter in a fairly original configuration, though I'm
not being 100% strict about that. For example, a previous owner had soldered
romex to the power input connector pins, so it had to be replaced. I want a
3-wire grounded line cord, but 3-wire twist-locks are too large
to fit in the lower cabinet rail, so replaced the original connector with a

cable clamp and hard-wired my new line cord to a 3-terminal barrier strip that I installed inside the cabinet.

Ok, enough rambling... Do any of y'all have an extra cabinet blower assembly lying around that I might buy or trade for?

This one goes inside the house, in my Secret Laboratory.

> Don't worry about the noise from a muffin fan it can't possibly be any louder than the original.

I have an original blower on the way to me now. Amazingly, the fellow who offered to me wanted something in trade that I actually had! That doesn't happen too often in my experience.

I'm down to one deuce, and I haven't done any significant MV stuff in the last few years. It'll bubble back up to the top of my hobby list eventually! Right now I'm going through another mil radio phase. I have too many hobbies to do them all at once! :)

Mark,

Be sure the blower for the 4-400 is operating and all of the screws are in place for the 4-400 shield under its chassis (and copper chimney is ok on top of the chassis).

The original squirrel cage blower on the back of the cabinet is noisy and I replaced mine with a 4" muffin fan.. There are no plans to operate RTTY 24/7 in the tropics so the airflow with the muffin fan has been enough to keep the T3 reliable for the past 20 years.

Let us know when you are on the air.

Tom W2ILA

I'll definitely let the group know when it's up and running, and I'll be using it on the weekly west coast MRCG net at the very least!

I have my PA blower motor out right now to replace its bearings. One bearing was all gummed up with dried grease. Adding some synthetic oil freed it right up, but it still felt a little bit rough to me so I decided to replace the bearings. I'll order up the replacement bearings after my cabinet blower arrives and I see if it wants new bearings, too. Thanks for the warning to check the screws around the PA tube.

P.S.: I also have a nice collection of various Trimble Trimpacks. :)

So there I was... looking for a T-368 on eBay, as I had been for a while. Suddenly, in late 2007, one appeared! It wasn't in pristine condition, and it'd need some work, but it had one very attractive feature: It wasn't on the opposite coast! In fact, it was pretty close to me. I don't remember where, but certainly within a hundred miles. Having tired of silliness like buying a $6500 truck from a guy in Maryland and then spending an additional $5500 getting it shipped to me in southern California, I decided that *this* T-368C was my perfect match.

So I bought it.

Then I stuck it in one of my sea containers, since I was beginning a home construction project.

Then a few years later, I finally got around to loading it into my new house, which naturally involved the use of my Bobcat, what with the radio weighing 750 pounds and my house having steps up to the front porch and all.

And thus we find ourselves here in the last moments of November, 2011, as a wind storm howls outside and I idly contemplate whether my GRA-4 mast will come bursting in through the window to get out of the cold. At least I assume it's cold; I don't feel like sticking my head out the door to find out. Let's just say that it's bitterly cold, because that makes the story better. Heck, as long as we're embellishing, let's make it a howling blizzard. Of snow. Snake-infested snow, even, and probably uphill both ways.

# 4842. Re-gluing 3B28 base

Yahoo group: T-368_BC-610
Date: 2011-12-18 08:23:19 UTC
From: Mark J. Blair
Topic: 4842  Message: 4842

I have a pair of NOS (?) 3B28 high voltage rectifier tubes for my T-368C transmitter that I'm fixing up, and I found that the glue has come loose on one of the bases. This is particularly bad because they go into twist-lock sockets that don't leave the base exposed, making it difficult to install/remove the tube without being able to twist it by the glass envelope.

I'm considering using JB-weld epoxy to re-glue the base, since I think it should be able to handle the heat. Do any of y'all have success or disaster stories about that?

Interestingly, when the envelope came free of the base, it slid right out. The two filament leads don't appear to have been properly soldered into the pins, and I don't see solder residue on them. I was also surprised to see that the leads are stranded wire, mated to the solid pins that pass through the glass envelope. Previous tubes that I've seen baseless had solid wire leads which extended all the way through the glass envelope. I suppose that the heavier wire leads needed for this tube would have been too stiff (and thus put too much stress on the glass/metal seal when flexed) if they were solid.

Mark,

These are also used in the BC-610s.

Being straight with you, I'd obtain another 3B28 and NOT mess with soldering and gluing.

A GOOD solid tube is a MUCH better bet than going through what you are looking at doing. The downsides are too great. You just don't need the possible failure mode.

It is cheaper to find another good one, rather than have a failure. A failure can get expensive fast.

My $0.02 worth.

Mark,

  Yes, JB Weld did the trick for me on my 3B28s in my T3.
  I repaired them several years ago and they keep working.

 Also,  JB weld did a fine job of sealing a leak on  an insulator on the plate transformer
!
That repair has lasted for 5 years now.

*IF* it was ONLY a loose base, I would agree.

BUT, in this instance he is looking at - First, tinning and soldering leads in a base where he CAN'T be positive of the lead placement. Second, then gluing the base to the tube envelope.

That is why I said it is cheaper and better insurance to obtain a good 3B28 rather than repair and glue.

I'd hate to see someone cause damage to an old radio that "could" be expensive to repair.

3B28s are all over the place, and fairly inexpensive.

My separated tube looked pristine until the base came loose, and only then did I learn that the pins weren't properly soldered. Once I resolder the pins on my tube myself, I'll be confident that they're well-soldered. Heck, if I solder them before the adhesive sets, I can make sure that they're soldered by verifying that they're holding the envelope in place.

Seriously, if I don't even attempt a simple repair of a consumable item that will never be manufactured again because I "could" make a mistake doing so, then I'm in the wrong hobby.

On another list, one of the responders suggested electronics-grade RTV due to concern about epoxy cracking the glass (and others did report success with JB-Weld). I happen to have some Dow-Corning #748 non-corrosive RTV. It's rated for use at up to 350 degrees F (177 degrees C). I think that should be adequate to survive the heat during operation, but do any of y'all happen to know the normal glass temperature for this sort of tube?

Mark,

It is NOT my intent to insult your ability or your desire to preserve something no longer produced.

I too, have been repairing my own radios since I became licensed in 1980.

I procured spares for mine.

I DO understand the view. I also KNOW that the major power supply components for both the T-368s AND the BC-610s are hard to come by.

That is what drove my post.

I'll back away and leave you alone.

I'm also concerned about blowing out something hard to replace, so I'm trying to check everything out pretty thoroughly before I apply power for the first time. For all I know, my radio might already have something like a blown power transformer, since I bought it as a non-operational project. I've been cleaning up contacts, checking relays, looking for anything that looks modified, etc., and I plan to check a lot of stuff like interlocks, all of the tubes (except the big transmitting tubes that my TV-7 doesn't have sockets for), and so forth. I've replaced the missing cabinet blower since I do not plan to operate it with the back cover off and the interlocks defeated, and I've replaced both bearings in both blowers.

There are some tubes I'm replacing as a matter of caution; e.g., I found some corrosion and a couple of loose pins (one of which came entirely off) on one or two of the 5R4WGB tubes, and I plan to just replace them all since there's no good way for me to see what's going on inside those big bakelite bases. I'm just not too worried about the 3B28, though, because it came apart neatly, it looks nice and clean inside and out, and I expect to be able to repair it and then test it with no substantial risk of imminent failure. In any case, the normal running spares for the T-368 included a single 3B28, so I figure that if the designers were concerned about a catastrophic failure from one of the two 3B28 tubes going bad, then they'd include two spares with instructions to replace them in pairs.

Thank you for your concern, and I'm looking forward to a nice T-368/BC-610 QSO with you someday!

Mark,

    RE testing the HV supply -  use a variac .
  Wire it into the  "Test" plug  on the back of the T3.
  Heck, I left mine in and have the variac mounted in the  rack with the receiver.
  I can dial the power out all the way down to 50 watts out of the T3 before  my modulator get a little non linear.
 And frankly a bias adjustment would most likely take care of that.

Uhm... two pins are of different sizes than the other two, and there's no
polarity in the filament leads, so... I agree with Mark... It seems like
Nonsense.

I've repaired 866's the same way, except I ran electrical tape carefully around
the base/envelope junction with a dab of fingernail clear-coat to keep the end
of the tape in place.

Still in a power supply, today.

~shrug~  I don't get some people...

Folks,

NEVER said it was a BIG DEAL! Simple reading would show this.

My personal view is different. Get over it.

I look at what CAN go wrong, NOT that it is simple and easy. Since the filament caries filament voltage and a Medium to High voltage, possible arc over inside the base IS possible.

What others have done or will do is up to them.

My personal view is to get a good one. Simple solution.

Haven't burned anything up yet. Don't plan on starting.

Some will bypass interlocks. I will not.

Everyone is different.

FOR SALE: Crystal Sockets

FT243 Crystal Sockets - 1/2" spacing X 0.094" diameter pins

Single FT243 Socket - two hole mount - classic style with shoulder - $8.00 each
(24 available)

Single FT243 Socket - smaller black type - single hole mount - $6.00 each
(4 available)

DUAL FT243 socket - square phenolic, Cinch, single hole mount, accepts two crystals - $10.00
(1 available)

QUAD in-line FT243 socket for multiple crystals, end to end on nice small copper subchassis - as used in DX100 - $24.00
(1 available)

HC6U Crystal Sockets - 1/2" spacing X 0.050" diameter pins
These are new ceramic sockets, single hole mount.
Available for $3.00 each or ten for $25.00 plus shipping
(60 available)

Triple hc6u socket - black or white - $5.00 each
(2 available)

Used hc6u sockets available for $2.00 each
(4 available)

CR1A (20C, DC30) crystal sockets, rare - pin spacing 0.5" and pin diameter 0.125" - for $4.00 each

Ehh,...

What may have happened is that there was a poor connection to the 2.5 volt pins which has enough current draw to make enough heat to melt solder.

Clean pins, check springs,...

Read Start-up file on home page,

Joe

I never tried it but the red RTV silicone used on exhaust manifolds
should work ok. The leads probably melted the solder due to overheating
Good Luck, George W5GRG,AFA6GG

Look fo r a gob of solder in the bottom of the tube socket.

Check the HV wiring to the sockets and all of the  rest of the HV wiring for cracks, if you find ANY replace it all.

I have a pair of NOS (?) 3B28 high voltage rectifier tubes for my T-368C transmitter that I'm fixing up, and I found that the glue has come loose on one of the bases. This is particularly bad because they go into twist-lock sockets that don't leave the base exposed, making it difficult to install/remove the tube without being able to twist it by the glass envelope.

I'm considering using JB-weld epoxy to re-glue the base, since I think it should be able to handle the heat. Do any of y'all have success or disaster stories about that?

Interestingly, when the envelope came free of the base, it slid right out. The two filament leads don't appear to have been properly soldered into the pins, and I don't see solder residue on them. I was also surprised to see that the leads are stranded wire, mated to the solid pins that pass through the glass envelope. Previous tubes that I've seen baseless had solid wire leads which extended all the way through the glass envelope. I suppose that the heavier wire leads needed for this tube would have been too stiff (and thus put too much stress on the glass/metal seal when flexed) if they were solid.

# 4861. FS: Boxes of Electrolytic Capacitors

Yahoo group: T-368_BC-610
Date: 2011-12-20 12:46:16 UTC
From: Bry Carling
Topic: 4861  Message: 4861

FOR SALE: ELECTROLYTIC CAPACITORS

Mix of radial, axial, upright can - some NOS. Almost all are new.
(one or two may be good, tested caps)

BOX #1 = QTY 35 electrolytic CAPACITORS
QTY 2, 0.068 uF at 630 V
QTY 2, 0.056 uF at 630 V
QTY 1, 4 uF at 600 V
QTY 2, 8 uF at 450 V
QTY 1, 8 + 8 uF at 450 V
QTY 2, 16 uF at 450 V
QTY 1, 125 uF at 450 V
QTY 1, 10 + 10 uF at 450 V
QTY 2, 820 uF at 450 V
QTY 1, 40 uF at 450 V
QTY 1, 68 uF at 400 V
QTY 4, 220 uF at 400V
QTY 2, 33 uF at 400V
QTY 1, 40 + 20 + 10 uF at 350 V
QTY 1, 22 uF at 350 V
QTY 1, 10 uF at 350 V
QTY 1, 100 uF at 250 V
QTY 1, 100 uF at 200 V
QTY 1, 4700 uF at 35 V
QTY 1, 4.7 uF at 35 V
QTY 2, 2200 uF at 25 V
QTY 4, 100 uF at 25 V
Total of 35 excellent capacitors for $45.00 plus $12.00 shipping

BOX #2 = QTY 40 electrolytic CAPACITORS
Mix of radial, axial, upright can - some NOS. Almost all are new.
QTY 2, 0.068 uF at 630 V
QTY 2, 0.056 uF at 630 V
QTY 1, 16 uF at 600V
QTY 1, 0.47 uF at 600V
QTY 2, 47 uF at 450 V
QTY 1, 20 uF at 450 V
QTY 1, 10 + 10 uF at 450 V
QTY 3, 82 uF at 400 V
QTY 5, 220 uF at 400 V
QTY 1, 33 uF at 400 V
QTY 3, 0.47 uF at 400 V

QTY 1, 22 uF at 350 V
QTY 1, 3 uF at 350 V
QTY 1, 47 uF at 250 V
QTY 1, 33 uF at 250 V
QTY 1, 270 uF at 200 V
QTY 1, 100 uF at 200 V
QTY 1, 1 uF at 200 V
QTY 1, 1000 uF at 50 V
QTY 2, 2200 uF at 35 V
QTY 1, 4.7 uF at 35 V
QTY 1, 1000 uF at 25 V
QTY 5, 100 uF at 25 V
QTY 1, 2200 uF at 16 V
Total of 40 excellent capacitors for $45.00 plus $12.00
shipping

BOX #3 = QTY 30 electrolytic CAPACITORS
Mix of radial, axial, upright can - some NOS. Almost all are
new.
QTY 2, 0.068 uF at 630 V
QTY 2, 0.056 uF at 630 V
QTY 1, 16 uF at 600 V
QTY 1, 125 uF at 450 V

This tube came right out of a box and hasn't been run in my transmitter yet. I didn't see any signs of solder melting on the pins; they looked the way they ought to from the outside. The filament leads didn't appear to be wetted with solder. When I pre-tinned the ends of the leads prior to reassembling the tube, it took a fair amount of flux and cooking to get them to accept solder (I used 63/37 tin/lead).

> Check the HV wiring to the sockets and all of the rest of the HV wiring for cracks, if you find ANY replace it all.

Will do!

# 4864. T-368C master oscillator cabling

Yahoo group: T-368_BC-610
Date: 2011-12-30 19:12:40 UTC
From: Mark J. Blair
Topic: 4864  Message: 4864

The coaxial cabling in my T-368C's master oscillator is rearranged compared to what my TM shows, and I was wondering if there might be a good reason for this particular cabling before I blindly put it back to what the manual shows (i.e., if this is a known cabling modification that was made for good reason).

The manual shows the PTO output connected to J101, the FSK input connected to J102, and the external exciter connected to J104. In my set, the PTO output is routed to the external exciter connector through a comical sequence of adapters, the FSK input goes to J101, and both J102 and J104 are open. My TM suggests that coaxial adapter(s) do belong on the external exciter cable, clamped to a standoff like in my set, but I think my set has grown a few more adapters in the pile.

This scheme would require an external jumper between the FSK and external exciter connectors to operate normally in non-RTTY use. That would seem odd to me if I didn't have prior experience with the T-195 transmitter, in which two internal cables get swapped for RTTY use, an external jumper is needed for non-RTTY use afterwards, and the whole topic gets one obscure footnote on one diagram in the TM!

I plan to use my transmitter mostly for AM service. I do have the RTTY modulator, though, and I plan to try using it for RTTY at some point, too. I suspect that I should be able to put the cabling back to what the TM shows unless it was swapped around to compensate for some fault in my transmitter that I haven't found yet. So, have any of y'all seen this sort of cabling rearrangement before?

My list of excuses to delay plugging my transmitter in for its first smoke test is getting short. Yay!

# 4865. T-368C PTO heater

Yahoo group: T-368_BC-610
Date: 2011-12-30 19:20:51 UTC
From: Mark J. Blair
Topic: 4865  Message: 4865

While looking over the master oscillator chassis in my T-368B, I've found that the wires to the PTO's heater jacket have been clipped. There's a scuff on top of the jacket that has exposed a couple turns of wire, but the wire doesn't look damaged, and I measure around 15 ohms across the heater terminals. The thermal switch is open at room temperature, which I don't think is correct.

Do any of y'all have an idea about how much my oscillator's stability will be affected without the heater operating?

Do any of y'all know the normal opening temperature of the thermal switch? If I can't salvage a good switch from a surplus PTO, then I should be able to kludge in a suitable replacement if I know what the temperature should be.

From: Mark J. Blair
Topic: 4866  Message: 4866

My T-368C is missing the tube hold-down clips on the thermal relay, the three rectifiers on the modulator deck, and the two 4-125A tubes. While none of them should be necessary for my non-mobile installation, I'd like to replace them anyway. I haven't had any luck finding the right kinds of clips online so far. Does anybody have a lead to a source for these clips?

BTW, the PA chimney is present, and I know that one is necessary.

Mark,

  Sounds like your T3 is set up stock for RTTY.
Do not panic....
I found the same situation in mine when I was first getting it going.
Disconnect the MO from its connection to the front panel and connect it to the input on the PA deck.
Now when you do acquire a MD-239 and desire to run RTTY you know what to do.

Mark,

Checking my manual which covers Basic through C models I find a note on the schematic of the MO and first buffer stages that says "Heater HR801, thermostat S801 and capacitor 811 on main schematic are not used." When I go the main schematic for my Basic I find HR801, S801 and C800 are shown sure enough on the main schematic for my Basic but there is no power coming in to the heater circuit on Pin H of J105, the mating connector for P802 coming off the MO assembly.

In the T-195 the MO heater is hooked up and kicks in when the ambient temp falls below zero degrees C. In the T-368....??

Aha! I assumed that the heater was intended to keep the PTO at a fixed temperature, much like a crystal oven, and thus it would be on at room temperature. If it's only for cold weather and it only turns on at freezing, then I shouldn't miss it at all.

I was just checking out the filament and mod bias rheostats in my set. Despite disassembling it, cleaning and re-tensioning the moving contact, and cleaning up the resistance element with crocus cloth, the filament rheostat still has some dead spots. The bias rheostat looks questionable in the first and last thirds of its rotation. I hope they'll work better under working load than they do with my DMM... Anyway, I think I'm getting close to my first smoke test.

From: Mark J. Blair
Topic: 4871  Message: 4871

This evening, my T-368C got its first taste of power in many years! It's semi-alive, but needs more work:

* No actual smoke seen; just a healthy (?) amount of "hot dusty stuff" smell.

* I can't seem to get the PA to load up at 150mA in tuning mode as the manual directs; tuning for max RF output gives me about 100mA plate current and 65-70 watts of RF.

* Full power mode is no-go: I hear some arcing sounds, then the overload relay trips.

* Both blowers work, though the PA blower is quiet enough that I can't hear it over the cabinet blower.

* PA grid drive reads a bit high at 15mA.

* Int. amp plate current reads 25mA.

* In AM, I can only get the modulator bias current up to around 40mA. I don't trust the bias potentiometer based on DMM testing earlier today. Whistling into the mac doesn't swing the meter higher.

* The filament voltage meter is a bit sticky; I need to thump on it to see small changes in voltage.

* I don't like having the back cover interlock defeated during testing, but those big tubes sure are pretty when they're all lit up!

Congrats, Mark. They can be a bit fickle when waking them back up from a long sleep, but once you get through the bugs and make it all good, they are solid performers. Generally a case of dirty contacts/connections, with the occasional partially-smoked component. Got mine making RF earlier this year, still need to address the jumpy PTO that changes frequency every time the transmitter is keyed. Then it should be good to go.

It's always good to hear of another one finding its way back to the world of RF.

Thanks! I'm really excited to finally have power going in one end of this beautiful beast, and a bunch of it coming back out the other end! Good luck on your PTO problem.

A small update: I'm trying to locate the arcing problem in AM mode, so I can watch the back of the transmitter while I turn on the plate voltage with the mic PTT. It doesn't trip the overload relay and/or plate breaker every time, and when it doesn't, I get 250mA of plate current and 500W of RF output! Still no modulation, so I don't think I'll be running the rig on tonight's West Coast MRCG net.

The arcing sounds like it's coming from roughly the lower right side of the rig, probably in or under the power drawer on the HV rectifier side. I haven't seen any visible arcing from the top yet. I see that V18 tends to make a purple flash at current discontinuities (plate relay turning on or off, including when an arc occurs), while V19 doesn't flash much.

I haven't found the spark gap specs in the manual yet, but the coils have markings indicating they should be at 0.020". So, that's where I set them. They were previously MUCH wider than that.

It looks like my excitation meter is sticky, too.

I obviously missed it before, but are you running 3B28s in the rig? Pretty sure you are.

One other tidbit I'd add at this point: have a friend come over to give you a hand tracking this down. Aside from the obvious safety issues, it's so much easier to track these kinds of gremlins when you have someone else at the controls. This allows you to move around for a better view and check other possibilities, while keeping someone at the other end who can check meters, run other tests as you're observing the inner workings, or shut things down fast if needed.

As well, that extra set of eyes and a fresh brain will quite often see something you've been missing. Not from ignorance, more likely from looking at it over and over and over...

Yes, I'm running 3B28 rectifiers in it. They both appear to be conducting, because I can see a small amount of purple plasma around the cathodes if I look from below. Only one of them regularly makes a purple flash filling much of the tube at current discontinuities, though. This is by far the highest powered tube rig I've worked on so far, so I don't know if that flash should be telling me something about the state of the tubes and/or the circuits they're in.

I just brought over my "poor-man's friend": I set up my DSLR on a tripod behind the rig and took some HD video of the 3B28 rectifiers while operating the set from the front. :) Besides the plasma flashes that I mentioned inside V18 before (which may be innocuous), I think I saw a couple of white flashes around the envelope of V19 that might be arcs over the glass or reflections of arcs somewhere else. Or, reflections of a bird flying by the open window. Hmm, I might be onto something here! Now, if only the bottom of the cabinet was transparent, so I could magically levitate the transmitter a couple feet in the air and shoot video of the bottom of the power supply drawer to look for arcs down there...

More progress!

I don't seem to be having the same arcing problem as before, and I'm not tripping the overload relay now.

I tracked down my modulation problem to an open plate resistor for the audio clipper, which stopped the audio at that stage. After replacing the resistor, I have modulation now!

I'm not out of the woods yet. I'm doing some testing with a signal generator at the audio input, and my plate circuit breaker trips after 5-10 seconds of full power + full modulation. I don't know why yet.

I don't see the modulation pattern on my scope fully closing to the zero crossing before distortion sets in as I raise the input level, but that may just be an artifact of how I'm probing the RF signal (a wire loop crammed through one of the extra mounting holes on top of the cabinet, which may be picking up lots of stuff other than the true output signal).

I found what looks like a fine replacement for my bad modulator bias pot on eBay, and it's on the way. I also have a few small replacement tubes on the way to swap out tubes that look marginal on my TV-7D. Some of those tubes are for an OS-8C scope that I'm also repairing with hopes of using it as a station monitor. I like the form factor of that little scope, and I plan to try tapping off the audio inside the modulator deck to make a proper trapezoid display so I can see any overmodulation or nonlinearity.

I won't be able to spend as much time on my transmitter once I resume work tomorrow, but I may still have it on the air in two or three weeks, depending on when parts arrive. Yay!

Mark,

FB progress!

If you're running 500 W carrier and pushing the modulation to 100%
with a continuous tone you're kicking the beast kinda hard which could
be why the breaker is popping. The specs say 400 - 450 watts carrier
out for AM. Try dialing back the loading to 200ma or so PA current
and see how it behaves. This may allow you to pinch off at the
carrier at the baseline too. With the 4-150A modulator tubes only
running class AB1 the rig is not long on audio power.

BTW, I monitor my modulation with a 100X scope probe connected
directly to the antenna output. At 400 watts out into a 50 ohm load
the P-P voltage would be about 300 volts and 600 P-P under
modulation. Not sure what scope and probes you are using though.

Dennis

I think that part of the problem is that my bad modulator bias potentiometer isn't letting me get quite enough idle bias current through the modulators. Then, when I was turning up the input signal and looking for pinch off, I probably drove them way too hard. If I carefully turn up the input level until just before I see some distortion, then it seems to sit there warming up the room with no problems. Incidentally, this is the first time I've ever felt my dummy load warm up above room temp (rated 250W dry and 2500W with water pumped through it).

> BTW, I monitor my modulation with a 100X scope probe connected

Right now I just have a loop of wire dangling a couple inches down through one of the extra mounting holes on the top of the cabinet to pick up stray RF in there. My scope probes are expensive and delicate 10x 500MHz jobs and my scope is a fancy Tek DSO (a little out of date with its floppy drive, but still pretty modern). It's visible on top of the beast in may latest blog post:

http://www.nf6x.net/2012/01/t-368c-transmitter-progress/

I have an OS-8C scope that I'm fixing up with hopes of using it as a station monitor. I guess I should make a 100x or so sampling probe to hook to the RF output rather than just dangling a wire about. Maybe I'll make something fancy to hook inline with the coax outside the unit, or maybe I'll tack on the divider inside the cabinet, since I think I'll tap off audio from the speech amp to drive a trapezoidal display on the scope anyway. Hmm, with those extra mounting holes on top, I could mount a couple of RCA jacks without drilling any new holes. I might leave off the big antenna tuner (which would just be eye candy anyway) and put the scope there instead.

Anyway, I have a hunch that once I get my new mod bias pot, I should be burning out my antenna balun in no time! :)

I just get a length of coax with a BNC on one end, and run it outside into the field of the antenna, with a two or three turn loop on the end of the coax. Too many stray RF fields in/around the transmitter - grid voltage, etc... what the transmitter puts out, is outside.

Just a thought.

73 = Best Regards,

Please tell us you are loading the T-368 into a "Dummy Load"
for your testing and such? The T-3 like the BC-610s act differently
when on an antenna, as opposed to on a 50 ohm Dummy load!

The Dummy load eliminates the vagarities(sp) of a changing load
to the output section. Stages will be stable once set with the use
of a Known Load on the output fo the T-368. FWIW

Yes, I'm loading it into a 50 ohm dummy load for my testing. I won't try to load it into my antenna until I have it working properly on the dummy load.

Good Job Mark,

I recently moved to new home! Got antennas up and am putting
the "Big Iron" back together for getting back on the air (AM) mostly
I am in the process of getting the "rigs" back into operation, hopefully
by the time of the various contests/get-on-the air events.

Got various "Heaters" set up in my garage with remote control and
metering into the shack (Basement), was experiencing hum on the audio lines,
Shield was broken inside cable for the audio feed to the Transmitters.
Took a while to find the break, but it caused confusion for a bit.
Direct audio worked fine, at the units, turned out to have a break
in the shield causing intermittent. SMALL things matter, and don't
chase "wild geese"! Enjoy the refurb tho wanna hear it on the air.
Jim

I just brought over my "poor-man's friend": I set up my DSLR on a tripod behind the rig and took some HD video of the 3B28 rectifiers while operating the set from the front. :) Besides the plasma flashes that I mentioned inside V18 before (which may be innocuous), I think I saw a couple of white flashes around the envelope of V19 that might be arcs over the glass or reflections of arcs somewhere else. Or, reflections of a bird flying by the open window. Hmm, I might be onto something here! Now, if only the bottom of the cabinet was transparent, so I could magically levitate the transmitter a couple feet in the air and shoot video of the bottom of the power supply drawer to look for arcs down there...

Yeah, sounds like you have arcing in the wiring under the 3B28 sockets.

Thanks! I'm really excited to finally have power going in one end of this beautiful beast, and a bunch of it coming back out the other end! Good luck on your PTO problem.

A small update: I'm trying to locate the arcing problem in AM mode, so I can watch the back of the transmitter while I turn on the plate voltage with the mic PTT. It doesn't trip the overload relay and/or plate breaker every time, and when it doesn't, I get 250mA of plate current and 500W of RF output! Still no modulation, so I don't think I'll be running the rig on tonight's West Coast MRCG net.

The arcing sounds like it's coming from roughly the lower right side of the rig, probably in or under the power drawer on the HV rectifier side. I haven't seen any visible arcing from the top yet. I see that V18 tends to make a purple flash at current discontinuities (plate relay turning on or off, including when an arc occurs), while V19 doesn't flash much.

I haven't found the spark gap specs in the manual yet, but the coils have markings indicating they should be at 0.020". So, that's where I set them. They were previously MUCH wider than that.

It looks like my excitation meter is sticky, too.

* Full power mode is no-go: I hear some arcing sounds, then the overload relay trips.+++++++++Not good, find it soon.

* Both blowers work, though the PA blower is quiet enough that I can't hear it over the cabinet blower.++++++++The vibration from that blower can be felt by grabbing the left handle on the RF deck.

It seems to have subsided, but I figure it is likely to reappear eventually (maybe when the weather is less dry than it is now). The wiring seemed to be supple and uncracked, but I could have missed something. I expect to be going through there and looking over the wiring and insulators again soon... Just not looking forward to heaving that power supply drawer out again! :)

I don't have to lift mine!  I put a block of wood under the front panel and use that to hold it if I don't have to get under it.  If I have to move it I tip it face-down onto a dolly.  If I have to work on the bottom I roll it over and support it with another block of wood.

Or, you could get one of those die carts from on of the many, many defunct manufacturing concerns of our country.

All these fixes are interesting. I finally gave-up on man-handling the beast as I don't have any local help readily available.. Since all my Boatanchors are in the basement shack, I purchased an Electric Hoist from Harbor Freight and mounted it to a well supported ceiling joist. It handles 1300lbs with two lines. I can roll the T-368 under the hoist, pull out a drawer far enough to hook a chain to the openings on each side of the drawer. (No problem avoiding damag to the T-368).This balances the drawer beautifully. By raising the drawer slightly with the hoist, the cabinet can be rolled away. I then lower the drawer to a mobile work station. Return the drawer in the reverse manner.

I also use it to maneuver VHF and UHF Repeaters and Base Stations.

When I used to have to take the PS out of my T3, I used one of my son's skateboards. That way I was able to handle it by myself. The skateboard was just the right height that I was able to pull out the drawer and let it rest on the board and then roll it away. Then I was able to tilt it on its side to work on it. To put it back, just reversed the process.

When I first got my T-368F about 25 years ago, it was really in bad shape. I took it totally apart. I took out all of the cabling from the mainframe and re-painted the entire cabinet. When I replaced the wiring, I used new HV wire and thrashed all of the old dried out stuff. I also took off all of the front panels an re-painted them as well. When I was done it looked like new, and worked great. 73 - Mike

Great job, Mike:

I know that you are more proud of your T-3 because you made it what it is. I know that I couldn't do all that work.Do you use it often? I don't ragchew very much but I check into two AM Nets weekly.

I was very fortunate to to find one that looked great cosmetically and worked great. Had to do very little to it. Had to replace the plate Tuning Capacitor. It is an "E" Model. According to the Tag on the cabinet, it went through the Depot on 04-11-69. No doubt, that contributed to the good condition.

Best '73 and a healthy and prosperous 2012.

Thanks for the tip about the skateboard. I have found that a piano bench is the right size for the modulator deck. Just put a towel across the bench and slide the deck over to it. If I have to get under it, I call for help. I can still manhandle the rf deck.

I used a floor jack with a plywood base I made that attaches to the floor jack. It's nice to use the hydraulics to adjust to the height of the pwr supply drawer and then raise it up high enough to where I do not have to bend over to lift it but just grab it and heft it onto the service cart. It's been a while since I've had to do that...and was a bit younger then too:)

I replaced my spotty modulator bias potentiometer with a new one from eBay. That didn't cure my low modulation situation, though. I have the rig tuned up for 180mA plate current and 400W carrier, and I can only get about 50% modulation. I can get 100% in tuning mode. I have the bias set for 50mA indicated on the excitation meter (whose calibration is questionable, even after I readjusted the bearings... I still need to check it against a my DMM). At that, I have the modulation boas pot turned up almost all the way. If I recall correctly, I indicate about 100mA modulator plate current at 50% modulation in operating mode, and I can't get substantially more modulation by increasing the bias (I can get less modulation and more distortion by turning it down, naturally).

Is this a problem, or is this normal for this transmitter, with its "short" audio power?

By the way, I'm not popping any breakers at the moment.

Eimac tube specs for the 4-125A say that typical operation is
2,500v in Class AB1
600v on the screens
-96v grid
50mA at Zero signal (idle)
Max-signal plate current is 232mA
that gives it a plate-to-plate Z of 20.3kOhms, requiring 96v grid input voltage (per tube)
They should be producing ~330w output.

I'd check the drive to the grids.

If the modulation transformer was open, you'd have heaps of current on the primary, and very little on the secondary. seems you're not getting much current swing on the primary, so that's what had me going in the direction of the drive to them -if- the problem is in the modulator. What all is in between the modulation transformer and the final? Check that path for resistance, as well. The high side of the mod xfmr should go directly to the final. There might be a resistor off of there to drop the B+ to feed to the screens for proper modulation. check it, as well.

Good luck! Keep us posted.

Thanks for the suggestions! I had worked my way forward through the speech amp up to the clipper (where I found a hard failure) when I was fixing the no-modulation problem. Now, it looks like I need to work my way back from the final modulator stage to see what sorts of signal levels I have.

Anyone with this setup?

If you do, could you tell me, looking from the front of the BC-610, which pin, left or right. has the RF on that in that little box that plugs into the XTAL socket?

I can't determine using a DVM or VTVM, wich pin is the RF one, and which one is the ground pin.

Those two meters show Zero ohms to ground. It is most likely that there is a small inductor that doesn't have ENOUGH DC resistance.

I'm going to connect an HP-3336B to the TUs as a frequency source. Essentially as a VFO in lieu of the M.O. which is entirely TOO touchy to reasonably set the frequency over the range of the TU.

Thanks in advance!

Bob - N0DGN

Mark,

How do you have the clipping control pot (R44 )on the speech amp chassis set? You should start off with it turned all the way CCW (no clipping). (I have the filters and clipper completely bypassed on my Basic, BTW.) Presume you are testing with an audio oscillator. Where are you feeding in the audio signal, i.e., through one if the jacks on the front of the rig or through the connector (J12) on the back?

I have the clipping pot turned CCW. I'm feeding the audio oscillator (AN/URM-127) into the carbon mic input on the front panel through a DC block cap. I haven't tried inputting through the rear connector yet.

OK. I take it that beyond a certain point the modulation percentage will not increase no matter how much you advance the output level of the oscillator and/or the gain control on the xmitter? Does the audio waveform as seen on the RF envelope become distorted when you do this, i.e., start to flat-top for ex? Just for fun, have you tried a microphone to see how much modulation you get? The M-52 or whatever else you used to use with your T-195 should plug right into your carbon mic connector on the front.

The modulator tubes in the T-368 are running in class AB-1 which means the grids are never driven positive and so the speech amp has to deliver voltage only, no power. What you should see at the mod grids with your scope is a maximum audio signal with a P-P value of approximately twice the modulator bias setting, i.e., something around 2X175 volts. You should be able to safely test this by pulling one of the 4-125s to get to the grid pin (#3) and then keying the transmitter and applying an audio signal WITH THE HV CIRCUIT BREAKER IN THE OFF POSITION. If you see the full audio signal swing at the grid the problem is somewhere beyond this point. If you don't then the problem would be back in the speech amp.

Yes.

I'm using a TMN6054A mic for testing (when I'm not using an oscillator). It looks the same: I can't pinch off the waveform, beyond about 50%. Is there any problem with running in tune mode for an extended time? I might try that for the net tonight...

Ok, with plate breaker off and both 4-125A tubes removed, I can put around 440 Vpp at the 4-125A grids before the signal starts to clip. So it looks like I have sufficient drive at the modulator tubes, but they're not putting out enough audio power. I'll start examining the circuits related to the 4-125A tubes.

New to the list guys, can someone send me a photo of a Db meter used on the 610's? I have located a few boxes of 610 parts clearing out a basement and a square meter with Hallicrafters on it was in the mix. I can send a photo to anyone asking. Quite a few coils, plug in's, tubes etc. One plug in coil is still wrapped in the original box. May have other parts as well. May list what I have available to the list shortly.
Thanks

There is no Db meter on the BC-610s.

There is filament voltage, PA mA, and mA for exciter. This is on the BC-610 itself.

There is a square meter on the Speech Amplifier, it also reads mA for modulation and to set the Audio resting current at 40mA.

You might encounter that the 4-125A's are either gassy or flat. That happens in tube-life, from time to time...

My tube tester doesn't have a socket for big tubes like the 4-125A. Is there some way for me to determine whether the tubes are gassy via in-circuit testing?

Mark,

Could be one of both of the 4-125s gone soft. Or, could be low screen voltage. First thing, check to see if the screen VR tube string is all lit up. Four 0A2s in series for a total of 600 volts. Glow not always easy to see, you may have to check in the dark. Quick and dirty tube test, key the rig (into a DL, no audio), up the resting mod current (lower the bias) until you start to see color on the 4-125 plates. Both tubes should start to show at the same bias setting, if not the one still dark is the weakling. At 100 ma resting current both tubes would be at their dissipation ratings if equal. Needless to say don't keep the rig keyed for very long when you're doing this.

On my Basic the bias control is set at about 1 o'clock for 50 ma resting current. Not critical, I operate with 35 - 40ma resting.

On operating in the TUNE mode I've never done this for an extended period. Should be OK for long enough to get some signal/audio reports on the net tonight. Also, you're not noted for long winded transmissions in my experience... :^)

Thanks Bob,
This meter is square 3X3 and the hole is 2 3/4, it measures -10 to +6, no part number. Says DECIBELS and the hallicrafters, inc. May be from another military product.

All four of my regulator tubes fire (I saw them when I was arc hunting). I haven't measured the screen voltage yet, but I expect it's probably OK since the regulators are firing.

Good suggestion on watching tubes while turning up the bias. I previously noted that both plates get red hot, and thus both tubes are conducting, but I hadn't considered ramping the bias to see which one lights up first.

> On my Basic the bias control is set at about 1 o'clock for 50 ma resting current. Not critical, I operate with 35 - 40ma resting.

The signs seem to be suggesting that one or both of my 4-125A tubes are weak. I guess I'll check the other resistors in the bias circuit, measure the bias, screen and plate voltages (assuming my HV probe goes high enough), and then if everything looks right then I'll order up a new pair of 4-125A tubes on Monday.

Mark,

Take a look at the metal skirt below the plate structure. Scorch
marks here a bad sign....

Didn't notice them before, but now I see them under the right lighting. I don't see scorch marks in the 4-400A, though it's harder to see what's going on under its larger plate structure due to the shadows that it casts.

As long as I had them out of the set, I figured I might as well share some pictures of those beautiful firebottles:

http://www.nf6x.net/2012/01/t-368c-firebottles/

Click the pictures to enlarge them, naturally.

The scorch marks are darker and more distinct on one of the modulator tubes, but they're present on both of them. Here's the worse-looking one:

I sure agree! I have two NOS ones on the way from an eBay purchase. Now I need to find some practical use for my old ones. They might not modulate fully, but they do still function. I suppose I can keep them as emergency spares if no better idea comes up.

# 4919. Balanced pro-audio line level input to T-368

Yahoo group: T-368_BC-610
Date: 2012-01-10 08:58:23 UTC
From: Mark J. Blair
Topic: 4919  Message: 4919

Have any of y'all successfully adapted the T-368's 600 ohm audio input to balanced pro-audio (i.e., XLR connector) line level input? I have a NOS mating plug for the rear panel connector, and I plan to mount a box on the back of the cabinet (probably with a magnet) with whatever jacks I want to hook up to the line input, PTT input, Rx muting line, CW sidetone, and so forth. I figure that I'd like to include a transformer in the box to adapt the 600 ohm input to a standard balanced pro-audio line level input, but I'm not sure yet whether I should use a 1:1 transformer or another ratio, whether I need an attenuator pad, etc.

If anybody here has blazed that trail before, then I'd appreciate any hints. And if not, then I'll just figure it out myself and then share the results!

I think I've been bitten by the AM sound quality bug. While I do not plan to hack up my transmitter, I may consider the simple/reversible mod I've seen to bypass the speech amp filters and clipper. Maybe I should make it switchable for those times when the classic mil audio sound strikes my fancy? I picked up a Shure SM58 mic on sale at Best Buy this evening (silly thing didn't work right out of the box, but I found a broken wire inside and fixed it myself rather than bothering to exchange it), and I'm poking about for a good deal on a Symetrix voice processor (maybe the bug I caught is terminal?). I already have a mic pre-amp that I've used with my T-195 before. Hunting through the list archives, I don't think I'm the first to contract this bug here, but I didn't find anything directly on-topic about properly adapting the 600 ohm input to standard pro-audio balance line levels.

Well, I'm off to bed now, hopefully to dream of glowing tubes and clean audio! :)

Mark:

If you've got the correct connector and a schematic go for it. I did. I went from the T3 connector about 5 feet to a mini-box 4 X 6 I think, in which I mounted a nice Triad 600:600 transformer. I put a female XLR on the box for line level input from a mixer. There's also a jack for PTT footswitch. You would not need a transformer if you are careful with your grounds and of course you could use a ring/tip/sleeve quarter inch instead of the XLR. There are quite a few mods to "improve" the sound of your T-368 ranging from easy to more complex. A couple of cap changes and some function bypassing in the speech amp get you a long way; I also made the mods to the RF deck including winding a new RF plate choke. Most fun I'd had in a long time. I also made the changes to read Cathode rather than Plate Current. The biggest advice I would give is to make only one change at a time and make sure it works before moving on to the next change.
I speak from experience here. I made changes to the audio deck and the RF deck simultaneously without checking my work thoroughly. Afterwards everytime I released my push to talk switch I got an arc in the RF deck. Then I'm scratching my head wondering where my problem was. I was lucky enough to have a ham friend KA4JVY who drove one of his decks 150 miles to swap with mine to narrow the problem. Once the problem was confirmed in the RF deck I found the problem. I've documented the problem on the net, so that others might not make this simple mistake. I have all kinds of audio processing gear left over from studio installations. I actually use NONE of it. I like my T-368 with a slightly modified D-104 setup, plugged into the carbon mic input (DC removed) on the front panel. What a great radio! Good luck.

Thanks! So, a 1:1 impedance transformer makes things right for standard pro-audio line level? I plan to have the transformer on the back of the cabinet to get maximum benefit from moving audio around the shack on balanced lines, but otherwise it sounds like I'll be doing something similar to what you did. I'll probably use my handswitch instead of my footswitch for PTT, because I have dogs that like to curl up around my feet while I'm operating.

> There are quite a few mods to "improve" the sound of your T-368 ranging from easy to more complex. I plan to stay well towards the "easy" end of the mod spectrum, particularly since I might determine that I never needed the mods in the first place afterwards. This'll be an educational journey, so I don't know where I'll end up yet. I don't want to de-DC my carbon mic input, so that I can still plug in an M-29, TMN6054A, or whatever at the front panel whenever I want. I'll be walking a tightrope between the side of me that likes to keep things original, and the side of me that wants to experiment, learn, and improve stuff.

Mark:

Without my manual in front of me, I can't confirm that 600 ohms is what the line input is on the T-3, but I believe it to be so. That's why I used the 600/600 tranny I had (it actually will do 150 too). Most of today's line level semipro and pro gear don't have a pure 600 ohm output. I've looked at a lot of mixers that have line outputs stated from 100 ohms and up, but no matter. Today's world revolves around a voltage source feed as opposed to the current feeds of yore. So an axiom I learned many years ago holds true today. You can feed a low impedance into a high impedance; you should not feed a high impedance into a low impedance.
Not saying it can't be done, but the common op-amp works right along with my axiom which I adopted long before there were opamps.

I have thought that the next time I have the modulator deck on the bench (hopefully not soon), I would install a small toggle switch to turn the mic bias on or off so that the carbon mic could be used as well as the D-104.

One of the things I haven't found out about the T-368 is their dates of manufacture. I have a late model TRW F series. I would like to know the build dates of all the models though.

I can share the contract numbers and so forth on my transmitter if that helps you get the manufacturing information that you want. I'm at work now, but I can do it later. I suspect that my unit is a Frankenstein mix of parts because the RF deck has a different shade of paint than the rest, the other two drawers have paper labels added stating something like "part of transmitter T-368C", and the cabinet has the hole pattern for the later sealed RF relay in the top. So, I would guess that my RF drawer is an original C drawer, and the rest is from a later variant that was retrofitted back into C configuration. That's not much more than a wild guess though.

I was thinking this morning that if I do decide to bypass the audio filtering in the speech amp (and I don't think I'd make any of the more involved modifications), maybe I could accomplish the bypassing with relays, replace the 600 ohm line level pot with one that includes a switch, and have the switch control the relays. I'd be able to drive the unit from either audio input in wide mode, or I could plug a carbon mic in the front, turn the 600 ohm pot all the way down, and I'd have stock military sound. No added holes needed for switching that way, either.

Mark,

The contract # *may* help. No guarantees!

A lot of these went through Depot, as did the R-390As, and had "modules"/"assemblies" swapped around as was needed to get them out the door and back in service as fast as possible.

The same cou;d be said for the BC-610/T-213s. The data plate is on the front panel. The three decks, RF/PA, Mod, and Pwr Supply may have come from any other in the same model, such as "E", "F", "G", "H", "I". The T-213 is another guess as it went into Depot asa BC-610 and came out a T-213. They simply placed a T-213 data plate right over the top of what the previous data plate was.

I haven't taken the T-213 plate off to see "what" it "was".

Our glass firebottles say Eimac on the base!

Hello guys , well , it seems to me that if you do any mods to a WW2 tramsmitter or any other gear , you are not operating a BC610 or some such any more. what you are using is something based on the original equipment. in the case of components which are unavailable any more, modern replacements must be used of course , but to keep originality it should stop at that. alan G4GEN

Times and Technologies will advance, Alan. This is inevitable.
Nostalgia is a popular past-time for those of us that are getting 'long in the tooth', as it were. The old military transmitters and for that matter, broadcast transmitters, were designed for frequencies other than those we enjoy on the Amateur bands. "Communications quality", as far as Military Specifications are concerned, sometimes preclude us from operating such devices under current Amateur Radio laws and regulations and modifications are required. Conversely, Broadcast band transmitters were designed for professional broadcasters, of which Hams are not, and they, too, must be modified to comply with Amateur Radio regulations. As for why new technologies can not be integrated with the old to keep these transmitters in current day compliance is a mystery to me.

Don't get me wrong. I'm not saying it's ok to rip the 250TH final out of the Beastly '610 and replace it with a 450TH and change the modulators out to 250TH's (or better). Then, I agree, it's no longer a BC-610. But, small enhancements, like changing the military designed restricted audio out for something more pleasing to the ear, or limiting the frequency response of a broadcast transmitter are not out of the question, in *my* opinion.

Personally, I'd rather see a T-368 use a 4-250 in the final, as opposed to a 4-400, so that the 4-125's can better modulate the produced carrier. As for why, see http://www.qsl.net/wa5bxo/asyam/aam3.html

73 = Best Regards,
-Geoff/W5OMR

There are also some who believe that as soon as the first original solder joint is melted, it's ruined, so it should be left as-is and not operated. Unless you're recreating a station for critical historical display, I don't see this as being necessary to operation. While I tend to agree so far as doing major surgery or trying to make a radio into something it wasn't designed to be, updates and improvements were a regular part of military life as well. Field Changes and Depot mods were common during the life of a piece of gear.

We need to keep in mind that after us, there won't be some huge crowd following along with great interest in preserving, much less using this stuff. Most museums don't even have an interesting in old radio gear, as they preserve and display what brings the crowds through the doors. We are an extremely tiny minority who is dying off and not being replaced.

IMO, every piece of gear that is returned to the airwaves lives on a bit longer, sparing it from the scrap heap. It also presents another opportunity to be heard or otherwise discovered by someone else now or later, as a result. If some modifications are involved in making this happen, I'm all for it.

It all comes down to a matter of degrees, and what you can live with. I applaud the folks who restore a piece to the nth degree as it's truly an art form in today's world. And I appreciate everyone who puts a piece of old gear back on the air, regardless of condition. It's one more signal to hear and hopefully work.

Hello!

There are many opinions about the older gear (Boat anchors) and what should be done with it. I do believe that is up to the individual that has bought/found/acquired it. Some of the rigs such as the BC-610(v) transmitters were modifthe military from their the original configurations to cover additional frequencies up to and include 200 kHz to 32 MHz.

this particular transmitter is a well-known RFI / TVI / AFI interference generator, and for any use by amateurs, REQUIRES modification to keep within the FCC standards for amateur equipment.

There was even a modification for the BC-610 that was made for use of these transmitters by the Inter-Amerian Geodetic Survey teams that were mapping central and south America back in the 1960s. This mod turned the '610 into a double sideband suppressed carrier transmitter!

Keep it original? Not if I drag one home. ( I had one when in the Panama Canal Zone back in the "60's, (It was modified for DSB). Worked well. ) I would intend to use it! I can not use it within the FCC1 1 1 rules without modification to suppress the spurious signals it produces, and it is certainly no good with it's internal VFO ! ! !

In original condition, you can expect to work your WATV award within 2 hours. Also expect to see some communications from the FCC and OO's about your signal.

It isn't all that!

I only add Either a Bud Low-Pass Filter, #LF-601, to the output SO-239.

Been running either a BC-610I or a T-213 this way since 2000 (or 1999),
and haven't had ANY issues with TVI/RFI/AFI at all.

The only thing I'm now changing, is to use an HP-3336B Frequency
Synthesizer. I just got tired of trying to *hit* the desired frequency
using the M.O. They are entirely too touchy.

No FCC notices, no neighbors knocking, and no OO cards. I got more
neighborhood squawks when running an Apache. (Total of one - a wireless
phone in a house.)

This is a total mis-characterization of the BC-610 family.

Only thing I *should* do is use a BIG Variac to lower the line voltage.
Haven't done so yet.

I used to be much more pedantic about the originality of my military gear prior to various experiences buying military surplus gear directly from the government, screening the equipment on active military bases and seeing it exactly how it came from active service. After seeing the cobbled-together mods that were commonly made in actual service, even including bullet holes in truck floorboards for drainage (very common in the roughly 100 ex-USMC HMMWVs I crawled over while picking mine out), my philosophy has become a lot more relaxed. To some extent, the concept of unyielding originality is something that we collectors have come up with, and only reflects upon the equipment that we cherish at the moment that it passed the threshold of the factory's loading dock. Sometimes it doesn't even reflect that; in the military vehicle collecting world, there are many collectors who create stunningly beautiful restorations, while period pictures I've seen of those same vehicles being manufactured show greasy handprints on freshly-painted body panels, tools carelessly left on hoods, and similar atrocities. Never mind that when we show up in a desert with our green trucks and decide they all need to be tan instead, the results look like the whole truck was dipped in a vat of tan paint and then the windows were hastily wiped off with a piece of newspaper!

I have nothing but respect and admiration for folks who pride themselves on the originality of their gear, and a well-done cosmetic restoration fills me with awe and delight. On the flip side, I don't like to see messy hacks, and I do agree with Alan that a substantially modified whatever clearly isn't the same beast any more. My personal compromise allows me to make modifications with impunity and without hesitation where they impact safety, like adding turn signals to my M38A1 or neatly installing a 3-wire line cord on my T-368C. For other things, I tend to avoid severe mods, prefer plug-in mods where practical, and stick with easily-reversible mods (preferably documented inside the unit so that the next owner can easily unwind the mod if they want to).

As an aside, a previous owner of my T-368C had soldered Romex house wire to the pins of its original 2-wire power inlet... is there a special circle of Hell for pin-solderers? :-)

I've been "Hauling around and operating my BC-610s since the late 1960s
early 1970s". Been Mobile in a pickup truck with trailer (for generators)

NEVER had problems with TVI in the city or from my Farm-House HOME!

I remember pulling into a non-functional rest-stop on 95 and also 75 and
giving demos to the folks that were wondering "what that was!", One Lady
asked "what kind of "CB" radio that was? So whenever I made the NY to GA
run to see my "Folks" I took the "Big Rig" with me. Operated 80 and 40 CW
and Fone with a BC-348 on the front seat with me. Only problem was, I had
to pull over to change bands, but that usually happened at a "Pit Stop"!!!

I hear folks talking about TVI from BC-610s, My neighbors all knew I had
radios even came over on occasion to Oggle them and once or twice asked
me to see if I could make a "Phone-Patch" to some out of the way place.
Read that as calling to the Local "General Store" and having them fetch
someone
to the Phone.

BC-610s are versatile, easily repaired and with regular maintainance will
last
forever. "It DON'T" have to be "BROADCAST QUALITY" it just has to
C_O_M_M_U_N_I_C_A_T_E Plain and simple, if you do it right it works
that is the whole of the matter.

Of course, "Your Milage may VARY!!!

Jim

# 4933. BC-610 operation

Yahoo group: T-368_BC-610
Date: 2012-01-11 16:53:03 UTC
From: rbethman
Topic: 4933  Message: 4933

They really are simple to use and operate.

Those that have complained about them have either NEVER got one working, or do NOT know how to use the Mic Gain on the BC-614 Speech Amplifier.

You can VERY easily over modulate these. I've driven them into a dummy load, and have seen them on a Bird (Manufactured with Peak reading built in.), and hit over 2500W.

So you indeed MUST ride herd over them to keep them inside the legal limits.

The Mod deck input Audio transformer shows 150cps to 3000cps for audio input to the 2A3s. Yes, they are a little broad in audio.

That is what the original transformer reads. I have a couple of replacements for them, as they indeed do go South from time to time. However I've yet to need to replace one.

The replacement transformer goes up to 4500cps.

Proper adjustment of the BC-614 limiter is a good thing to do. Replacing the 60+ year old paper caps probably wouldn't hurt either. Haven't done so yet.

Got mine from another Ham whom got several from Army MARS in Europe. He's been running them since the '60s. He hasn't gotten any FCC letters, NOR has he gotten a card from an OO.

That would be WB2FCN.

YMMV

Hello again , well , when mine was going, i had people check around my frequency for spurious signals , and none were heard . i would say that the BC939 would filter most out . what i like is operating the whole SCR399 set up just as it was when it was used in the ardennes offensive.
i have not painstakingly refurbished it , and the paint in the shelter is original. of course if an owner wants to do mods , why not , it is just not the original equipment any longer .in VMARS our society, there are several BC610s which are used on our saturday morning net. there are 3 in this country and some in holland. they all sound marvellous with broadcast quality am . now things are getting less hectic i must get my one going again . i fell guilty about it every day. alan

I run my BC-610 E stock standard never had a single problem with TVI or any other interference issues, many of my 'Boat anchor' radios are stock like my ARC-5, ART-13 and the BC-375/191's even they have never caused me any concern whatsoever, all this TVI problem is often generated by the operator mistuning or running the radio out of its design limits. A lot of issues are caused by antenna mismatches as a lot of Mil gear is designed for 5 Ohm antenna systems whereas most Ham ops are used to 50 Ohms, there lies one of the biggest initial problems.

I don't know about the "E" model.

I only have an "I" and a T-213.

Just as the TM demonstrates, you can easily feed the SO-239 into RG-8 or RG-213 and use a properly constructed dipole.

That's how they get operated here.

The BC-939 is NOT an "Antenna Tuner" it *IS* an "antenna coupler". It is designed to take the 50 ohm output and *couple* it to either specified lengths of wire for the different frequencies which are in the TM, - OR - Uncle Sam's vertical whip.

When the BC-939 is used with the specified length of wire, you have a 300 ohm output when tuned as directed.

well , the BC 939 is an amazing piece of equipment. it does what it designed to do very well. nothing else though ! i use either the whip antenna or a 40 ft wire . it couples the tx to these fine . if you look at L5, there are so few turns on it that it is hard to see how it presents any significant impedance at low frequencies, but it does .i am sure that this will bypass most spurious signals to ground .i have a johnson kilowatt matchbox for use with a doublet, but there is so little room in the shelter that i seldom use it . i find the doublet works best with the cord 1290 . incidentally, Max's signal is one of the BBC quality ones ! alan

I think the 21 Mc IF's in poorly shielded TV sets of the 1940's gave a lot of medium powered transmitters a bad rap.

That shouldn't have been an issue with the BC-610s.

The different countries that operated them only had the PA coils and TUs
for up to 18Mc.

So I don't see where 21Mc gets into the equation.

hello , funny , but when i first got interested in getting a BC610 some 30 years ago , i was told that they were dreadful TVI producers. it could have been the 3rd harmonic getting into the 21 meg if . i never thought of that at the time. it does not happen any more , and TVi is more or less a thing of the past with uhf and digital TV .as Max says , properly operated they do not cause any trouble .I have a W/S 53 which was the british replacement for the BC610. it is much more sophisticated and uses a pair of 813s in the final. i was told by the colonel here some years ago that they were operating one in germany and received an urgent call . apparently they were putting out a signal on a transatlantic HF frequency. i use mine via a harris RF601 auto coupler , with no problems. incidentally, my one is supposed to have gone over in a Bedford QLR radio truck the day after D day , and went to the REME museum after it was withdrawn from service. alan

Alan;

That is interesting about the British version of the BC-610 and it using two 813's. I wonder did that unit run a lot more power with the 813's? Would have to boost the Power Supply though. The ART-13 ran a single 813 but still ran about half the power capability of the 813.

Harold

From: Roger Basford
Topic: 4940  Message: 4943

Hi All,

To be fair, I think a lot of the reputation that the BC-610 had/has is down to sloppy operating when these radios were much more common in ham service. Only a couple of years ago, when I was on the 80m Old Timers CW net using my 610-E another op on the net was calling it a "QRM-Machine" and I've seen specific references to "badly-adjusted BC-610s" in 1950s UK ham magazines when talking about 20 metre band pile-ups.

I would guess that now that the majority of 610s are in the hands of collectors/enthusiasts that they are run a little more carefully and not flogged to get that last watt or one percent of audio out of the radio in pursuit of some rare DX station. Given the price of 250 and 100THs, not to mention mod transformers, we're not likely to emulate the DXers of the 50s, I hope!

One thing, TVI might not be so much of a problem in the age of digital TV but other appliances may suffer as well. I am beginning to suspect that an occasional problem I have with my broadband Internet connection (speed dropping and varying erratically) might be down to my radio operations. At the moment I'm using exclusively a TCS station on 80 metres CW, not the BC-610, at least until the problem is resolved.

hello . well , i find that i have to remove the power from my D-link when i intend to transmit with anything . if i do not the broadband goes up the pole. my phone line in is fairly close to the antenna feed. regarding the W/S 53 , the two 813s give 350 watts CW and 250 phone , and last well. i have a pair of russian ones in it which being of recent manufacture give about 10% more RF . i suppose they have a harder vacuum. they were used in cyclotrons to provide the rf which kept the beam going. this meant that they were in production for a long time. you can find out about the 53 on the web. the VFO is very stable, but as with the BC610 , i generally use xtals . herewith a photo. you can just see the telefunken E52 which i use with it mostly, and behind is a canadian W/S 52 .
cheers, alan

Apologies for the blank email, was trying to delete the unnecessary fluff when suddenly it displayed 'sent'.

Alan, I don't think anyone would disagree with the healthy interest in old gear more in recent years. Witness the explosion of AM activity over the last decade compared to the previous several. Old gear gives folks the opportunity for enjoying a more hands-on experience over today's plastic plug-n-play-then-throw-away equipment.

And though prices for old gear are still higher than they were 25 years ago, they are down overall considerably in the past few years. Exceptional examples still and always will bring high prices, but the feeding frenzy of 5-10 years ago has clearly subsided.

It's easy to lose sight of this, but when we think of an increased interest in old radio gear, it's an increase within our already-small group. When you get outside of a microscopic slice of the population that any of these lists represent and look at the bigger picture, it's easy to understand why more people don't object to inaccuracies in radio equipment used in movies, for example: they don't know the difference, much less care. I've often wondered if any of us attended the opening of a new movie featuring radio equipment and polled the viewers leaving the theater, how many would know the difference. Of a theater full of several hundred people, *maybe* one or two - if any? A clear indication as to interest now and in the future for old equipment. Classic car shows are another perfect example: great turnouts with far more interest than radio holds, yet how many old vehicles (1940s, 50s, even 60s) do you see on the road daily?

This is in no way an argument against what we all appreciate and enjoy, merely a redirect toward reality. It's up to us to carry on this interest, well beyond the lists of like-minded folks to a younger generation, if we want it to carry forward. How many younger (below 30 or 40 years of age) do you know with personal interest in old gear? Or radio itself? Amateur radio was the internet of its day, but even then numbers weren't a great portion of the overall population.

BTW, I think your BC-610 set up is a HUGE step in the right direction, and far more than many of us do beyond accumulating equipment for our own use and entertainment. If we have hopes of it living on beyond us, we need to insure an ongoing interest and desire from the historical as well as technical side.

~ Todd, KA1KAQ/4

hello tod , well , i agree with everything you say.interest in radio is diminishing due to other technologies. however investors see that things which can never be replaced will always keep their value. in the end all our precious stuff will be collector's items and merely looked at. however i do think that the day is a long way off yet.
we do a lot of providing stuff for films , and i agree with what you say about that. when we were doing "the band of brothers" i emphasised that it was not possible to communicate with a BC1000 using a BC611 . they made that mistake in " kelly's heroes". what did they do . just that .it looked good .it all depends on the art director.
on "the empire of the sun" we had replica gunsights in our replica zeros . just in case a glimpse of the cockpit interior was shown . originally the cannons were made of wood and looked great, however charlie bishop the art director insisted that we make them out of metal. he said blown up on a wide screen you would see the grain.
the extra weight put the aircraft out of trim and we had to put a lead weight in the tail.
i am putting a photo of one of the planes which i was flying on my scr399 file . cheers, alan

Description in the 1960 "Surplus Schematics Handbook" by Cowan:

BC-610

"While it is possible to use the BC-610 with the tuning boxes, the stability resulting is not consistent with the current amateur standards and will probably lead to considerable correspondence with FCC monitoring stations plus rapidly deteriorating neighbor relations due to TVI, BCI, HAI, EOI, etc. Ad Nauseum. 4 screws remove the tuning box assembly. It is a simple matter to drive the transmitter with a low power VFO by mounting a SO-239 connector to the exciter deck and driving the 807 buffer-multiplier. If a higher power exciter is available, the 250th final may be driven directly. Don't rejoice yet. The TVI is still there."

I run my BC-610 E stock standard never had a single problem with TVI or any other interference issues, many of my 'Boat anchor' radios are stock like my ARC-5, ART-13 and the BC-375/191's even they have never caused me any concern whatsoever, all this TVI problem is often generated by the operator mistuning or running the radio out of its design limits. A lot of issues are caused by antenna mismatches as a lot of Mil gear is designed for 5 Ohm antenna systems whereas most Ham ops are used to 50 Ohms, there lies one of the biggest initial problems.

Square, Bob?

Not to pick nits, but as late as the I model, the meter on the BC-614 is
round.

My E model had a round meter on it, but in some pictures, there -is- a
Square meter. (D) model, I believe

Well , i did use the vfo once on our cw net and reports were not all that bad. however , the BC610 was designed to operate on fixed frequencies and does that best with an xtal. using one there is nothing wrong with the tuning unit . troubles come i should think when you try to use the tuning unit like a modern vfo . however the idea of drilling holes in this beautiful thing in order to change frequency easier seems dreadful to me. the RAF bomber command T1154 transmitter suffers the same problem when we used them in civil aircraft they were converted to xtal control . more recently people have made small xtal oscillators which plug into the oscillator socket . these work beautifully , and the old girl sounds fb .
i would imagine that a BC610 tuning unit could be easily adapted to house a modern design of vfo .there are plenty of them around , so wrecking one would not be significant. however i do not see what is wrong with having a large stock of xtals . alan G4GEN

John Mohn used a Collins 310-B exciter, as the VFO. The output of it
was coax, terminated on a double banana-plug jack, that fit perfectly
into the xtal socket of a TU. He's open the top access panel
(disabling the B+ with the active interlock) toss the thing in Transmit
(which only enabled the exciter) and zero-beat.

I heard this same argument, in the 70's;

"transistors are in, tubes are out. No one will know what this stuff is in a couple of more years. I oughtta just take everything apart and scrap it at the salvage yard..."

and you know what's happened? The price and demand for these old radios has SKYROCKETED! In the late 60's, early 70's, you couldn't GIVE an old transmitter away. Look at 'em now! THOUSANDS of dollars for what was once considered a useless hunk of scrap iron.

Don't sell the future short, guys... where do you think -we- got our interest from?

Todd (and all) I was licensed in early 1984. I've been around radio all my life. Prior to getting my ham ticket, one of my favorite past times was fiddling with any old receiver, tuning across the bands and listening to hams talk, or listening in while my dad was working some round table on square-jaw. The latter in my teen-years. In most of those more serious SWL'ing sessions, there's -always- been at least one AM qso, and there was always drama and conflict near/about it. The shining Beacon riding the tall ship of the airwaves was Don Chester/K4KYV, and Don was usually working people further East, with significantly lesser stations.

The point is, AM has been around since we Fesseden started broadcasting music in December of 1902 and it's still here today. Like all things, interest (in general) is cyclic. Let's enjoy the peak of this cycle, shall we?

Spoken as one who enjoys the -mode- of AM operating, be it a military transmitter or one that's home-brewed.

73 = Best Regards,
-Geoff/W5OMR

You do NOT have to wreck or cut up a BC-610 to run an accurate VFO or other frequency source into the TUs.

There is already a series of ventilation holes on the side, right by the TUs, or even directly behind them. RG-58 fits fine. I'd just add a little self-fusing Scotch 23 to ensure that the cable doesn't get chafed or cut.

The O-39 had its cable go through one of those, and plug right into the crystal socket. Or the other common method is to leave the cover over the TUs open - yes - bypassing the interlock. How else is a crystal changed or the M.O. tuned to get on frequency? Do you reaaly believe that they shut everything down to change frequency? These were operated while moving, not just parked in a fixed position.

A large stock of crystals isn't always feasible. The majority of the old gals are not found as an entire intact SCR-399/GRC-26C.

Most are found as a stand-alone BC-610, BC-614m and if lucky, you may even locate a BC-939.

E.F. Johnson VFO-122s have been used, along with PTS-040s, and HP-3336(A,B, or C)s. All of these do not modify the TUs, they plug directly into the XTAL socket.

Yes, SQUARE! I have one on a BC-614-E.

The one on the BC-614-I is indeed round.

Your experience is limited.

Very hilarious!

Observation by Spectrum Analyzers shows no VHF/UHF parasitic oscillation
as stated by another on the list.

Neither does it show harmonics that cause TVI.

Still use the TUs, and feed them through the XTAL socket with various
pieces of modern equipment such as PTS-040s, HP-3336(A, B, or C).

Standard military equipment supplied with the SCR-399 - the O-39 for FSK.

Same results on the Spectrum Analyzer.

Would do better to actually try testing one yourself.

Not some anecdotal writings by someone that didn't have such test
equipment available

hello geoff , well , i must agree with all you say. i thought of doing just that with a frequency synthesiser , but decided to stick with xtals. like you i started young. a bit earlier though. i joined the school radio club in 1948 and of course all there was were war surplus items. it was at the peak of a sunspot cycle , and we made a 10 metre am tx using a 6L6 pa . i remember working your side of the pond and getting s9 reports. i passed my technical exam in 1952 , but dropped ham radio when i started flying. i passed the morse test 22 years later to get my licence ! cheers, alan

Hear, Hear,
Well said Geoff! Well said indeed. I run BC-610s on AM/CW/RTTY,
I like them cause they work constantly, seldom "break" and when "broken"
are usually easy to repair.

I built "My version" of a Semi-Homebrew AM rig, turned out to be,
A Heathkit DX-100, Driving a single GG 4-1000A on 160 - 10 meters.

Whenever I run the "Beasties" I can carry on thru the QRM! When I run
the 4-1000A&DX-100 There is NO QRM Heard!!

I practice the "Go Big or Stay Home" philosophy, seems to work best!

As always YMMV!

I will be "Wrecking" one crystal. It is a 2105KC crystal that does not fall into ANY ham band available.

I'm going to gut it, bore a ho;e in the top to fit a length of RG-58 or even RG-59.

Facing from the front panel, the RF goes to the XTAL socket on the right pin. Ground to the left.

It'll be fed from my HP-3336B.

Then I simply poke in the frequency that I want.

Accuracy is 10KC over the span of 1Mc to 20.9999999Mc.

Output from -72dBm to +7dBm.

It will be more than acceptable.

When I read that, I laughed for a month or so, didn't have the
"Heart" to tell him he should get one and try it, and NOT
rely on "Hear-Say"!

In the 1970s I ran RTTY on 20 meters from Rochester, NY
To Wautoma, Wisconsin, every friday for my "Missus" so
she could "Chat" with her girlfriend who moved back there
from Rochester, N.Y. They did that for more than a year,
The operator there became a "silent key", and we both went
to the Funeral.

Radio "IS" period, nothing more, nothing less, than an adventure.
Make the best of it, "Dare to try the IMPOSSIBLE"

I like it! Zero harm is done to the transmitter. It's all gain and no pain, and the result is a perfectly respectable bit of operating/test gear.

That is the entire objective. I get extremely stable frequency control,
and don't have to hack the radio to do it.

Earlier post were recommending removing the entire TU section and
feeding the buffer/oscillator with something obscene and unnecessary.

The radio is perfectly good as is!

The only thing I haven't done yet is to add PTT. That's next on my list.

That's kind of my point, Geoff. A couple differences, though.

In the 70s, radio was still king for the most part. Us kids had a radio in our rooms to listen to our favorite music. Some of us listened late at night and heard stations coming in from all over the country. Others had access to sets with the 'short wave' bands on them and got to hear more. Today kids get their music from the internet, MP3 players, and so on. When I pointed out to my wife recently who is a K-8 school principal that most kids don't know what radio is (unless you mentioned internet radio), she told me that most kids don't know what a CD is.

The other part is that those of us who did become interested in radio and visited a radio ham got to see much of the current 'classic gear' in everyday use then. It was everywhere. Today the chances of a youngster coming across old gear in operation is pretty slim, unless we change that. The magic of radio is undeniable, but what was once commonplace is more the exception these days. Speaking with WA2PJP a couple nights ago, Joe, reminded me that you can't just go in any old store today and buy a radio for your kitchen or shop like you could a couple decades back.

And of course, the "THOUSANDS of dollars" you mention, while still true for the best, most complete items, is more like hundreds or less these days. I've tracked prices on ebay and elsewhere for the last several years, they are steadily declining overall. The reason being, those of us who grew up wanting the stuff along with those ahead of us who couldn't afford it back then have pretty much filled up our nostalgia collections. There's no nostalgia for the current generation, because they didn't grow up with

radio as a top technology like we did. In the small town where I grew up, CB radio of the 70s was our local internet. Shortwave listening and later amateur radio (1983 in my case) became the focus. Not so for kids today.

I don't disagree that we can interest young people in carrying on what we enjoy, but only if we take it to them. Otherwise, how will they ever be exposed to it? Public schools??

It's up to us, plain and simple. At this point, we are the future.

For me it was Chuck WA1EKV now K1KW and Tim, along with others. Never heard Don until the last decade or so, maybe because he only retired a few years back and wasn't on as much. Odd that you should mention him though, as last night I was on talking with Jeff W2NBC and a crew on 3.875 when Chuck popped in. Sometime later as others left, Don arrived. First time I've worked him on the air in several months, though I see him all over the 'net. Conditions were great, it was definitely a night for big signals.

And to what Jim says about QRM, I'd agree and only add - what QRM? (o: When you're in a roundtable with stout signals, it's only as bad as you choose to make it. So long as someone in the group doesn't acknowledge the nitwits trying to interfere, they don't exist. It's only when some braniac decides to scold them by saying things like "I think there's someone dumping a carrier in there", "you need to grow up" or whatever else that it becomes an issue. All they need is verification.

As Don says, simply turn up the wick, and strap. I wish more folks with BC-610s and T-368s would put them on the air regularly. They work well for attracting folks from the dark side(solid state) as much as for providing strong signals.

that idea with an xtal sounds excellent . i was thinking of using a couple of banana plugs. for the time being though i will stick to xtals. i suppose most of you can grind xtals . if not here is a good tip. all you need is an accurate rx with digital read out , an oscillator , a piece of plate glass and some 80 grade wet or dry abrasive paper.
wrap the paper tightly round the glass , and wet it. check the frequency of the xtal , remove the slab from the holder and grind using a figure of 8 motion for 1 minute. grind on one side only. wash the slab , re assemble it and check freq. you will be able to estimate the grinding time from that. do about half the time and check again and so on. if you overshoot, put a stripe of pencil lead or rub solder on the grinding side to drop it. i have done lots like that. when re asembling, check the slab is held between the side of the plates with raised corners . if it is the flat side , the xtal will not oscillate. i suppose this is old hat , but it is surprising how many hams these days do not attempt it.

That's all true, but one of my coworkers with teenage kids surprised me recently by disclosing that his kids and many of their friends are not only into LP records, but also listening to 70s era rock from bands like Aerosmith, Eagles, The Doors, etc. Not only that, but last time I was a Best Buy, they had a small rack of real LP records. And I've heard that many new bands release small runs of their albums on vinyl. Apparently, the idea of music coming out of a spinning plastic disc that you can touch and feel, with no computers involved, is magical to them in much the same way that an entire music library living on a cellphone with no moving parts might be to somebody from an older generation.

I approve of all of this, yet it seems creepy and disturbing to me that teens are listening to music that I like. It just doesn't seem natural! :-)

Barrie,

I already have a useless crystal. Cost $0. Why buy something when I
don't need to?

Since it is 2105Kc, neither it fundamental, doubled value, (4210Kc), nor
tripled value, (6315Kc), is of use in a legal manner for Amateur use.

I.m certainly NOT applying for a Short Wave license! Who would sponsor
some nut like me - just so I could cover the costs of running this thing
on a regular/continuous basis?

Mark,

Etching works better. To do this you'll need ammonium bifluouride (NH4F.HF). Comes in the form of white crystals which you dissolve in distilled water to get a saturated solution. Has to be done in plastic containers, of course. Didn't have much trouble finding the stuff on the internet a while ago but don't remember where. Great article on xtals attached below (long!)

Dennis

The Quartz Shortage

The Ageing Problem

Post War History of the Industry

Problems of the Crystal Industry

EPILOGUE

Summary

With the aid of many of the people who were involved, this paper is an attempt to record the history of the quartz crystal industry in the USA. Although crystal units were in use at least a decade earlier, the beginning of the quartz crystal industry in the USA can logically be dated November 1941 when the Quartz Crystal Section was organized in the Office of the Chief Signal Officer.

The history of the industry is traced from its origin with the discovery of Piezoelectricity by the Curie brothers in 1880-81 to the present time. Special emphasis is placed upon the problems which were encountered and overcome in creating an industry capable of meeting the demands of the Armed Services of the United States and their Allies during WW II.

The record of cooperation among the large and small industries, governmental agencies, the armed services, universities and individual citizens inspires confidence that the most critical problem can be solved with cooperation, dedication and effort.

Introduction

The August 23, 1943 issue of LIFE Magazine carried the following letter to the editor:

Sirs: In proportion to size these little glass like quartz wafers are perhaps the most remarkable of all the tools science has given to war. When the story of the almost incredible progress in research and manufacture of radio crystals can be told, it will prove to be a tale of one of the war's greatest achievements. No less significant will be the fruit of these advancements to a new world at peace where crystals will be the vibrating hearts of most telecommunication equipment. Gerald James Holton, Harvard University, Cambridge, Mass.

The "story" to which Prof. Holton so prophetically referred has not been told and perhaps can never be told in detail. MacLaurin, in the book INVENTION AND INNOVATION IN THE RADIO INDUSTRY, one of the books in the MIT studies of innovation, published in 1949, does not even mention piezoelectricity or the quartz crystal unit. But Prof. Holton's prophecy concerning the peace time uses of "those

little glass like wafers" has been fulfilled far beyond anything that he could have foreseen.

The fortieth anniversary of the entrance of the United States into the great war known as World War II provides an appropriate occasion to review the "incredible progress" to which Dr. Holton referred even though quartz crystal units were known and in limited use more than a decade before that date. The 1939 decision of the Armed Services of the United States to convert its radio equipment to crystal control resulted in the creation of an industry which ultimately played an important role in the victory of the Allied Forces over the Axis Powers.

The years 1980-81 are also the centennial of the years in which the Curie brothers discovered the piezoelectric effect; the direct effect in 1880 and the converse effect in 1881.

It is fitting, therefore, that we should at this time look back upon the development of an industry which, in many respects, is unique; an industry staffed for the most part by people who were not trained scientists or engineers. On the contrary they were bartenders, lamp shade manufacturers, wood workers, stone cutters, mechanics and, above all, amateur radio operators or "hams". With a few professionals, most of whom knew little more than they about piezoelectricity and with a totally unsatisfactory basis of scientific information, these entrepreneurs tackled a job which would have taxed the ability of the most advanced and best equipped industrial concern in the nation. And they carried it off. But let us start at the beginning.

Early History of Piezoelectricity

Very soon after its discovery the Curies devised several instruments utilizing the piezoelectric effect. One of these was the piezoelectric voltmeter. Another was the piezoelectrometer which later became the basic instrument used by Pierre and Marie Curie in their work which led to the discovery of Radium. Otherwise, for more than three decades the piezoelectric effect remained little more than a laboratory curiosity. Further developments had to await the invention of the triode vacuum tube.

After the Curies the first application of the piezoelectric effect was made by Prof. P. Langevin in France in 1917. Langevin used X-cut plates of quartz to generate and detect sound waves in water. His object was to provide a means for detecting submarines and his work led to the development of SONAR and to the science of ultrasonics, the results of which are still making headlines (viz., the recent announcement of the successful use of ultrasonic imaging in mammography).

Langevin's work stimulated others to investigate the phenomenon of resonance in piezoelectric crystals. Among those who became interested were A.M. Nicholson of the Bell Telephone

Laboratories and Prof. W. G. Cady at Wesleyan University. Both men, working with Rochelle salt, observed the reaction of the resonant piezoid on the driving circuit and both applied for patents based upon their observations. Subsequent litigation resulted in a legal decision in favor of Nicholson who is therefore considered to be the inventor of the piezoelectric oscillator.

In 1919 Cady used a quartz piezoid to control the frequency of an oscillator and in a series of papers during the next three years he described the use of quartz bars and plates as frequency standards and wave filters. It is generally accepted that Cady was the first to use a quartz piezoid to control the frequency of an oscillator circuit.

Both Nicholson and Cady used devices which would today be called monolithic resonators having two sets of electrodes on the same crystal. It remained for Prof. G. W. Pierce of Harvard University to show, in 1923, that a quartz plate with only one set of electrodes could be made to control the frequency of an oscillator circuit using only one vacuum tube. Pierce's circuit has probably been used more than any other quartz crystal oscillator circuit.

Oddly enough, none of the circuits was understood by its inventor until Prof. K. S. Van Dyke, a student and colleague of Cady, showed in 1925 that the two electrode piezoelectric resonator is the electrical equivalent of a series resonant circuit shunted by a capacitor. He was able to relate the electrical parameters of the equivalent circuit to the physical properties of the piezoid. This information in the hands of Vigoreux, Wright, Terry and others led to the understanding of the piezoelectric resonator or piezoid and to its use both as a passive and as an active circuit element.

The importance of the discoveries of Cady, Nicholson and Pierce did not go unnoticed. In 1923 the Bell Telephone Laboratories established a quartz laboratory and the General Electric Company did likewise the following year. One of the individuals who recognized the potential of the quartz crystal unit was August E. Miller. In 1923 Miller left the optical business where he had become an expert in grinding quartz lenses to go into the business of making quartz crystal blanks for amateur radio operators or "hams"; the only market which then existed for the new device. It appears that "Augie" Miller may have been one of the first individuals to go into the business of making quartz crystal units.

In 1926 the A. T. & T. radio station WEAF in New York City became the first radio station in the United States to control its frequency with a quartz crystal unit. Within a few years all radio stations went to crystal control thus providing another small market for quartz crystal units.

Before 1926 all crystal units were X-cut bars or plates. In that year E. D. Tillyer of the American Optical Co. discovered the

Y-cut. The temperature-frequency coefficient of the Y-cut is about +100 ppm per C° whereas that of the X-cut is about -20 ppm per C°. This fact naturally suggested the possibility of making piezoids, the frequencies of which would be independent of temperature and so work was started in several places to exploit the idea.

During the year 1927 Prof. Gerald Fox of the University of Iowa spoke to a convention of "hams" on the topic "The Piezoelectric Properties of Quartz". His talk stimulated some of the hams to try to make their own crystal units. One of them was E. L. (Al) Shideler of Manson, Iowa who not only succeeded in doing so but continued to do so until he retired forty years later. Another was Bill Peterson of Council Bluffs, Iowa who founded the Peterson Radio Co. and continued to make crystal units until his recent death. Still another was Herb Hollister of Merriam, Kansas who continued to make crystal units until the end of WWII. This list is doubtless incomplete.

The interest of radio amateurs and radio broadcasters created a mini-market for crystal units and several small businesses were established to satisfy the demand. One of these was the Miller Laboratories started by August Miller in the year 1928.

In January 1930 QST published an article by J. Herbert (Herb) Hollister entitled "Debunking Crystal Control" in which he pointed out "its utter simplicity" and described how a ham could make his own crystal unit. During the same year F. Dawson Bliley founded the Bliley Electric Co. to supply crystal units mainly to the amateur market. Today the Bliley firm is headed by sons of the founder and continues to be one of the most respected companies in the business.

In 1931 Herbert Blazier founded Monitor Piezo Products Co. and began to supply crystal units to hams, radio stations and two-way communication systems on the West Coast. Monitor continues today under the direction of John W. Blazier, son of the founder of the company. Also in 1931, Theodore S. Valpey established the Valpey Crystal Co. which still continues as the Valpey-Fisher Corp. under the direction of the son of the founder, Mr. Ted Valpey. Jr.

In 1931, Dr. W. A. Parlin, Professor of Physics at Dickinson College in Carlisle, PA and three of his students, Ed Minnich, Howard Bair and Charles Fagan decided to try to make crystal units for their ham rigs. They were assisted by Grover C. Hunt, an amateur lapidist who was employed by the college as an engineer. Not only were they successful but in the following year Hunt produced the first commercial units to be made in the Carlisle area. All of the quartz crystal operations in the Carlisle area are direct descendants of Hunt's original efforts.

In 1932 Leon Faber, who had taken up the hobby of amateur radio in 1913, began to make crystal units in Sandwich, IL. His first customers were other hams. When WW II broke out Faber formed a partnership with James Knights who owned and operated a battery shop

in Sandwich. Their efforts produced the James Knights Co. which became one of the largest crystal manufacturers in the world. It continues today as the CTS-Knights Co.

The crystal units of the day were either X- or Y-cut plates mounted loosely between two metal plates which served as electrodes. With suitable temperature control frequency stabilities of a few ppm could be achieved. This was a vast improvement over the free running oscillators of the time but the temperature control equipment was expensive, cumbersome and power consuming. Furthermore, the construction of the units made them susceptible to the effects of vibration and precluded their use in aircraft and other mobile systems.

Meanwhile work had continued to try to find ways of making units which would be less susceptible to the effects of temperature changes. In 1929 W. A. Marrison of the Bell Telephone Laboratories described the first quartz piezoid with a low temperature coefficient. It was made in the form of a doughnut and was later used as the isochronous element of the first crystal clock. It did not, however, prove practical for general use. Efforts to develop a practical unit having a low frequency-temperature coefficient were successful in 1934 when the AT- and BT-cuts were discovered independently by Koga in Japan, by Bechmann and Straubel in Germany and by Lack, Willard and Fair in the United States. Two years later Baldwin and Bokovoy of RCA introduced the V-cut.

Shortly thereafter G. W. Thurston of the Bell Telephone Laboratories discovered that a quartz plate of the rotated Y-cut family could be rigidly supported between two metal plates by clamping it at a few points near the edge and thus providing an air space between the quartz plate and the metal electrode. Although slightly more difficult to produce, the clamped, low temperature coefficient plates were suitable for mobile applications and this increased the market for crystal units.

In response to the new market several new companies were formed. Among them was Standard Piezo Co., the first crystal company in the Carlisle, PA area; organized by Grover Hunt and Linwood Gagne in 1935. In the same year the General Electric Co., which had established a quartz laboratory in 1924, decided that the crystal unit was ready for commercial production and assigned it to the G. E. Laboratories at Schenectady, NY under the direction of C. F. Baldwin. In addition to units produced for internal use, a few were sold on the open market.

One of the most important influences on the development of the crystal industry in the period 1935-40 was the Galvin Mfg. Co. (Motorola). Mr. Dan Noble, ex-professor of Electrical Engineering at the University of Connecticut, was convinced that crystal control was essential to effective two way radio communication. In order to obtain the crystal units which he needed for his new two-way systems he

persuaded Mr. Galvin to place orders with and in some cases to subsidize a number of individuals who had some experience with crystal units. Among these were E. L. Shideler of Fort Dodge, IA, Herb Hollister of Wichita, KS and "Ted" Tedford of Cincinnati, OH.

Production methods in use at the time were quite primitive. Orientation was done with reference to the natural faces of the crystal and consequently only faced quartz crystals could be used. The usual procedure was to determine the orientation with respect to a rhombehedral face using a protractor to measure the angular position. Sawing was done with a rotating blade in a slurry of silicon carbide and oil or water. The blades were usually of copper although other metals were used and at least one innovator of the day used old 78 rpm phonograph records. The crystal was held at the approximate angle by cementing it to a glass plate with wax or plaster Paris and a test cut was made. The resulting plate was lapped by hand until it would oscillate when placed between metal electrodes, the upper one of which was called a "penny plate" because of its shape and size. Once oscillation was obtained, the temperature was changed by means of a hair dryer or with dry ice and the direction of frequency change noted. Then the saw, which had remained idle during the process, was readjusted and another test plate cut. The process was repeated until a satisfactory angle was found and, if any quartz remained, the crystal was sawed into wafers. Although simple in principle, this method of orientation had two serious disadvantages; it was slow because the saw was idle for long periods of time and the test results were often ambiguous because of the effects of twinning and of coupled modes. Even at best, the accuracy was poor.

In a short time it was discovered that polarized light could be used in determining the angle. By passing a beam of plane polarized light through the blank in the X-direction the angle between the plane of the blank and the Z-axis can be determined with an accuracy of a few tenths of a degree. The use of polarized light greatly increased the productivity of the factory and the quality of the product.

As the market for crystal units expanded in the late thirties, the need for mechanization increased. The first crude saws were improvised from milling machines, surface grinders, and drill presses. Later these were turned on their sides, fitted with diamond blades and equipped with crossfeed compounds from milling machines. Eventually the Delta Mfg. Co., with the encouragement of Elmer Wavering of Motorola, produced 5000 drill press saws. Still later the Felker Corp. (now Felker Operations) produced the Felker Dimet saw, operating on the same principle but incorporating refinements making it a better production machine.

After a slice of quartz, called a wafer, was cut from the crystal it was etched with hydrofluoric acid to reveal the presence of twinning and other defects which were marked out and discarded. The

remaining portion of the wafer (if any) was then diced into blanks ranging in size from 1.5 to 3 cm. The typical yield was 20 to 30 blanks per kilogram of quartz costing about thirty dollars. Unfortunately, many beautiful, fully faced crystals proved to be useless because of electrical and optical twinning which could not be detected until the crystal was sawed into wafers.

Blanks were lapped by hand on a rotating cast iron plate called a "stooging wheel" using silicon carbide and water as a slurry. After a few hours of work, the operator of a stooging wheel was usually contributing blood to the slurry from his/her finger tips. Many strange and wonderful devices were used to replace hand lapping. Louis Patla of DX Crystal Co., the first to produce crystal units in the Chicago area, recalls making a lapping machine from an old bread dough mixer. But most of the early laps were made from drill presses. A crank was inserted into the chuck and used to drive a metal carrier between two flat, annular cast iron plates while abrasive slurry was fed in through holes in the top plate. Metal carriers were replaced by plastic ones when it was discovered that, if the two metal plates were insulated from each other, the quartz plates would announce their own frequencies in a radio receiver. Soon the Atlas Machine Co. began producing drill press laps and the Atlas lap became the most commonly used lapping machine in the industry. In 1938 the P. R. Hoffman Co. was organized to produce machinery for the expanding industry. One of its first products was the Hunt-Hoffman planetary lap which is still widely used today without substantial modification.

Frequency measurements were made by determining the difference between the frequency of the test blank and that of some reference frequency such as a secondary frequency standard consisting of a one MHz crystal unit controlling a frequency generator which developed a set of radio frequencies having integral multiples of 10 kHz. Measurement of the difference frequency, detected by a radio receiver, was a major problem which was solved in various ways One of the early manufacturers, E. L. Shideler, used the family piano as an interpolation oscillator. More affluent manufacturers could procure an excellent analog frequency meter from General Radio Co. and within a short time David Packard and William Hewlett developed the HP-200 audio oscillator which not only met a need in the quartz crystal industry but also launched the Hewlett-Packard Corporation.

Final adjustment to frequency was done using a piece of plate glass as a lap and silicon carbide or emery as an abrasive. The operator applied force at diagonally opposite corners of the blank while moving it in a figure 8 motion on the glass plate thereby unknowingly reducing the thickness at the edges and creating the contour which is essential in thickness shear plates in which the thickness is not small compared with the lateral dimensions. Finishing to frequency was an exasperating exercise. The frequency of the plate is determined primarily, but not exclusively, by the thickness. But the amplitude or "activity" depends upon the lateral dimensions.

Frequently the blank has low activity when adjusted to the nominal frequency and edge grinding is required. But edge grinding has a second order effect on the frequency which often skips to a higher frequency making the blank unuseable for the desired purpose. This phenomenon, which is commonplace and well understood today, was in 1935 variously ascribed to demons or to the perversity of inanimate matter.

Nevertheless, with patience, experience and luck a skilled finisher could sometimes finish to frequency as many as twenty crystal units per day. And so with primitive equipment and methods and little or no understanding of the phenomena involved, the crystal industry in the United States produced an estimated 100,000 crystal units during the year 1939.

It is quite impossible to trace to their origins many of the innovations which were devised during this period. Many techniques, thought to be original by their inventors, were later reported to have been in use elsewhere at an earlier date. This situation was partly due to the desire to keep as a trade secret any innovation which reduced the cost or/and improved the product; and partly to the lack of any effective means of communication between the various entrepreneurs. After the United States became involved in the war patriotism took precedence over industrial secrecy and with only one or two notable exceptions cooperation rather than competition became the rule.

The Quartz Crystal Section

The decision to make large scale use of crystal control in military communication systems was made late in 1939. The Armed Services had considered crystal control before but the idea was always rejected on the bases of (1) lack of flexibility, (2) cost, and (3) unavailability. In the summer of 1939, during field maneuvers in Tennessee, comparative tests were made of FM vehicular radio equipment, with and without crystal control. About the same time some crystal controlled equipment, captured from the German Army by the British, was sent to Wright Field for evaluation. The result of these tests was the decision to convert all military radio equipment to crystal control. This was about two years before Pearl Harbor Day (Dec. 7, 1941) and after the war in Europe was already under way.

The wisdom of this decision was emphasized by Major General Roger B. Colton at the Chicago Conference on July 11-12, 1944 when, despite all of the problems which had by then been encountered, some of which were still unsolved, he could say:

"Our decision to go into crystal controlled radios for widespread tactical use has been more than justified by the results obtained. The Army had radio before they had crystals. Now the Army has communications. That's the difference. Crystals gave us communications."

Before the United States had seriously started rearming representatives of the British Purchasing Agency came to the United States to obtain equipment for the Armed Services of the U. K. One piece of equipment which they ordered was a VHF transmitter-receiver for aircraft use employing 4 crystal units in the transmitter and 4 in the receiver. The equipment was made by the Bendix Corp. and the crystal units were the DC-11 and the DC-12 types. This set, with a few modifications became the SCR-522, the most important airborne set in the U.S. Air Force and its crystal unit became the CR-1.

As the war in Europe increased in intensity it became apparent that the United States might soon be involved. The pressure on the fledgling crystal industry increased as it was asked to supply crystal units for the Allied Forces as well as our own. It became clear during the latter months of 1941 that a serious bottleneck was developing and that something must be done to expedite the production of crystal units.

If any date can be ascribed to the beginning of the quartz crystal industry in the United States it is probably late October or early November 1941 when the Quartz Crystal Section (QCS) was organized in the Office of the Chief Signal Officer (OCSIGO). It was headed by Lt. Col. James D. O'Connel and house in Bldg. Temporary A at Buzzard's Point near the old Army War College in Washington. The mission of the QCS was to expedite the production of quartz crystal units to meet the requirements of our Armed Services and those of the Allies. The first problem was that of finding personnel who could solve the technical problems and guide the industry which was to be. The original group of civilians in the QCS included:

Dr. Clifford Frondel of Harvard University

Dr. Richard Stoiber of Dartmouth College

Mr. Sam Gordon of the Philadelphia Museum of Natural History, and

Dr. William Parrish of the Pennsylvania State University, all of whom were mineralogists.

Dr. Wally Richmond and Mr. Hugh Waesehe, both of whom were geologists.

Dr. Carl Bertseh of Newark College of Engineering, a physicist and

Mr. E. K. Woods of the Patent Agency.

Among the Officers initially assigned to the QCS were:

Capt. E. W. Johnson Capt. Charles Miller

Lt. Les Atlass Lt. Willie Doxey

The task of this group was to organize an industry, determine what facilities were required and to make them available, obtain the necessary priorities for materials and equipment and to

expedite and schedule production. Furthermore it had to be done immediately. Although all three services had small groups working on crystal problems which were peculiar to their particular services, the QCS served as the focal point for the quartz crystal program in the U.S. during the next four years.

In July 1942 the QCS was moved to the unfinished Pentagon Building and Dr. K. S. Van Dyke joined the group as Chief Civilian. His knowledge of the basic theory of piezoelectricity added a much needed dimension to the staff of the QCS which had hitherto been made up largely of mineralogists and geologists. Early in 1943 Virgil E. Bottom joined the group. He was the first member who had actual experience in the manufacture of crystal units. A little later Dr. Allyn Swinnerton, a geologist and Vice President of Antioch College, joined the group.

Work of the Quartz Crystal Section

The first task of the QCS was to publicize the need for quartz crystal units in order to attract potential manufacturers. This was done so successfully that many letters were received from patriotic citizens offering to donate the crystal sets which had reposed in their attics for a decade or two. However the information did reach the desired places and would-be manufacturers of crystal units whose regular activities had been halted by the War Production Board began to descend upon the QCS asking how they might use their idle facilities to make crystal units. This group which included machinists, blacksmiths, jewelry makers, and amateur radio operators turned in one of the most remarkable records in the annals of American industry. In less than three years Mr. William Halligan, the President of the Hallicrafters Co. was able to say:

"We had no trained personnel to make crystals. We had no equipment with which to make crystals and out of this has been created what to my mind, is truly a miracle of American incentive and industry."

The information available to these neophyte crystal manufacturers consisted of a few articles in QST, an article or two in the Bell System Technical Journal and the patents which had been issued. A little later the Bell Telephone Laboratories came to the rescue with a collection of articles written by such authorities as W. P. Mason, Walter L. Bond, Roger Sykes, I. E. Fair, G. W. Willard, G. M. Thurston, A. R. d'Heedne, H. G. Weke and R. M. C. Greenidge. These papers were of inestimable value at the time and were later edited in book form by R. A. Heising and published by Van Nostrand in 1946 under the title QUARTZ CRYSTALS FOR ELECTRICAL CIRCUITS. These materials were made available to the new manufacturers who digested them, utilized them and, in many cases, made improvements upon them.

One of the first acts of the QCS was to expedite the development of X-ray diffraction equipment for use in orienting quartz blanks. This became the first commercial application of X-ray

diffraction. A few companies had adapted old dental X-ray equipment for making Laue photographs of quartz blanks but the process was slow and the results scarcely better than those which could be obtained with polarized light. At the Western Electric Co. a primitive form of Bragg diffraction equipment was in use by Walter L. Bond but this information had not reached beyond the limits of the Bell Telephone Laboratories. Contracts for the development of X-ray equipment were placed with the General Electric Co. and with the North American Phillips Co. under the surveillance of Dr. William Parrish. Both companies produced equipment in such numbers that most of the crystal companies were equipped with X-ray machines by early 1943. Although the equipment designed and built by the two companies differed in many respects, both were so well designed and constructed that many of the original machines are still in use almost forty years later.

Much effort of the QCS went into expediting equipment, supplies and materials for the new industry. Because of the critical nature of the program it was assigned a very high priority which, along with the authority of the OCSIGO, was often invoked to obtain critical materials. At one time a certain piece of equipment was almost within our grasp when it was snatched away by an outfit called the "Manhattan Project" which had a higher priority. Some of us wondered briefly why Manhattan needed a General Radio Primary Frequency Standard. Two of the men who became expert in working with the War Production Board and other agencies were Tom Parrott and Wally Richmond and many crystal manufacturers owed their daily ration of quartz to the efforts of these two men.

Due to the critical nature of the industry the decision was made to locate the production facilities away from the East Coast which was within enemy range. Accordingly manufacturers in the Central Region of the country were encouraged with the result that Kansas City and Chicago became manufacturing centers for the quartz crystal industry and remained so for years.

In May 1942 the QCS organized a training program in Kansas City under the auspices of the University of Kansas. The teacher of the course was John Zeigler, a young engineer, who had learned something about crystal units while working at RCA. The course was taught from copies of patents to a class of about 20 persons including Ernest O. Ruff and Edward Roper, both of whom are still active in the crystal business.

Soon thereafter Zeigler and George (Jack) McGrew organized a company called Crystal Products Co. Except for a small operation called Aerion, owned by the Aircraft Accessories Co., Crystal Products was the first crystal company in the Kansas City Area. All of the other factories in the area sprang from the company organized by McGrew and Zeigler.

By 1943 about 130 manufacturers were engaged in the production of crystal units. Twenty three of these were in the Chicago area, 20 in the New York area, 15 in the Carlisle area and 14 in the Kansas City area. The remainder were scattered over 20 states from Oregon to Florida and California to Massachusetts. The supervision of so many small plants, distributed over such an area was a major problem and the members of the staff of the QCS spent much time on travel duty instructing the new manufacturers, helping them with technical problems, correlating test equipment and settling arguments between them and the Signal Corps Inspectors.

The Galvin Mfg. Co. (Motorola)

The task of coordinating the activities of 130 companies was clearly beyond the capability of the small staff of the QCS in Washington and so the Galvin Mfg. Co. (later Motorola) was induced to assist in the program. Galvin was heavily engaged in the production of personnel radio equipment known as the "handie-talkie" and "walkie-talkie" sets, all of which used the FT-243 crystal unit. Under the direction of Mr. Elmer Wavering, Galvin Mfg. Co. undertook the Herculean task of expediting and scheduling the production of FT-243 units, testing and assembling them into kits each of which contained 44,000 units on 4400 different frequencies. Mr. Nick Anton, an assistant to Mr. Wavering, prepared and distributed a Crystal News Sheet which supplemented the grapevine and helped contractors to keep abreast of new developments and information related to the production of FT-243 units.

One important contribution of the Galvin Mfg. Co. was the CES-1 Crystal Test Set. The CI-meter had not yet been invented and standardization of crystal units was unknown. It was necessary to provide each manufacturer with a test set consisting of a mock-up of the oscillator circuit of every piece of radio equipment. These test sets were known as "black boxes" from the color and shape of the cabinets which housed them. Each "black box" was periodically returned to the Signal Corps Laboratory at Fort Monmouth for recalibration. The CES-1 consisted of a Pierce oscillator circuit in which the critical parameters were variable. It could therefore be adjusted to simulate a number of different radio sets, thereby reducing the need for so many "black boxes". The CES-1 helped greatly with the correlation problem but did nothing to solve the standardization problem which awaited the invention of the CI-meter.

Growth of the Crystal Industry

Except for the Western Electric Co., all of the crystal unit manufacturers in existence before 1940 were very small. Bliley, one of the largest, had fewer than 15 employees. Monito Piezo had about the same number. It is doubtful if more than 100 persons were engaged in the production of crystal units in the year 1939.

During the period 1941-45 employment at Monitor reached over 2000 and at Bliley over 1400. Scientific Radio Products employed

over 750 and a new plant, The Reeves Sound Laboratories in New York City which began production in the summer of 1942, soon employed nearly 1000. In Chicago the Ross Mfg. Co., headed by Ken Ross and the Beaumont Electric Co., operated by the Lieberman brothers, (who formerly manufactured lampshades) each employed over 500. Many smaller companies with fewer than 100 employees also made their contributions. One example was the Good-All Mfg. Co. of Ogallala, Nebraska which employed about 20 people.

In addition to the firms directly engaged in the production of crystal units, many many others were engaged in supporting activities. Diamond saw blades, abrasives, plastic holders, stainless steel electrodes, beryllium copper springs, neoprene gaskets, nickel plated screws and many other items were required to complete the assembly. Coordination of the production and distribution of these items was done by the War Production Board which attempted to match the limited supplies to the almost unlimited requirements.

This motley assemblage of manufacturers, coming from every part of the nation and from almost every type of activity turned in a most remarkable production record. Between 1941 and 1945 they produced an estimated 30 million crystal units.

The FT-241 Program

The radio equipment used by the armored cavalry and the field artillery divisions was designated the BC-608 series. This equipment used frequency modulation and operated in the 30-40 MHz range of frequencies. The crystal unit for the set was the FT-241, developed by the Bell Telephone Laboratories and produced by the Western Electric Co. Each set carried a complement of crystal units ranging in number from 72 to 120 thereby requiring an extremely large number of crystal units.

The crystal units, which operated in the frequency range 350-550 kHz were made with CT-cut quartz plates. They were made at the Hawthorne Plant of the Western Electric Co. in Chicago where more than 10 million such units were produced between 1941 and 1945. The production of this plant was reported to be one million units per month when it was shut down in the summer of 1945. A complete account of the development of the FT-241 unit is given by W. F. Drew and A. E. Swickard in Heising, Chapter XVI.

Although the Hawthorne plant was in a secure location militarily, it was early recognized that at least one more source for these units should be available. The technology involved in making the FT-241 was clearly beyond the capability of most of the small plants which were successfully making the FT-243 and CR-1 types. Accordingly a contract was awarded to the Federal Telephone and Telegraph Co. of Newark, a subsidiary of ITT, to set up a second source for the FT-241 unit. However, despite the expenditure of a large sum of money and much precious quartz and with the experience of the Western Electric

Co. available, the war ended before any units of the FT-241 type were produced outside the Hawthorne plant in Chicago.

The Quartz Shortage

One of the most critical problems faced by the QCS was the shortage of raw quartz. Although quartz is found in a few other places including the United States, practically the only source of natural quartz of electronic grade is Brazil. At the beginning of 1939 the United States had a stockpile of about 10,000 pounds of quartz suitable for processing into crystal units. During 1939 about 30,500 kg (67,000 pounds) of quartz was imported from Brazil. The amount imported in 1940 was 57,500 kg. Approximately 10% of this quartz was considered to be of electronic grade. Dr. Richard Stoiber was assigned the problem of expediting the supply of quartz.

Before the end of 1942 the supply of faced quartz which could be processed without the use of X-rays was nearly exhausted and the industry was forced to begin to learn to process unfaced quartz of which a considerable quantity was still available. Various techniques and devices were developed to enable manufacturers to use this material. These are adequately described by G. W. Willard in Heising, Chap. IV.

By the end of 1942 X-ray diffraction equipment began to become available to the manufacturers enabling them to effectively utilize unfaced quartz crystals. This relieved the shortage somewhat but the supply was still inadequate and steps were considered to increase the supply. The quartz mining regions of Brazil are not in the "hot, steamy jungles" but rather in the highlands in the central states of Minas Gerais and Goias near the capital city of Brazilia (which, of course, did not exist at that time). The mining of quartz was not then, nor is it now, an organized activity. The 'garimpeiro' (diamond hunter) would dig or hunt until he found a crystal which he could trade to a local merchant for supplies. The merchant, in turn, exchanged it for goods and eventually the stone reached Rio de Janiero where it was finally sold to the purchasing agent of the Metals Reserve Corp. or some other purchaser. This ad hoc system was incapable of meeting the needs of the growing crystal industry and the quartz shortage continued to become more acute. As an example, on Easter Sunday 1942 an executive order was obtained from the White House releasing 200 pounds of quartz which was needed for a special order for crystal units.

Various steps were considered for alleviating the shortage which was partly due to inadequate grading facilities in Rio. Consequently inspection teams were trained and sent to Brazil to inspect the quartz prior to shipment. Eventually several thousands of pounds of quartz were loaded on a ship bound for the Port of Newark. The ship was hardly out of the harbor before it was sunk by a German submarine. After that incident all quartz was flown to the United

States in DC-3 cargo planes at a cost of $2.00/pd. (1941 dollars).

In an effort to encourage the mining of quartz the purchasing agents in Brazil were authorized to double the price of quartz. However the authors of this strategy had failed to take into account the economic system of the 'garimpeiro' who was not interested in building up a savings account and who only dug or hunted quartz when he needed to replenish his supplies of rice, beans and pinga. Consequently the result of the program was less, not more, quartz and the program was abandoned.

It was then proposed that mining machinery be sent to Brazil. Accordingly a cargo ship was loaded with bulldozers and other earth moving equipment and dispatched to Rio. It was sunk enroute. Another ship was loaded with similar equipment. It arrived safely but most of the machinery never reached the mining areas because of lack of roads and that which did reach the quartz mining area proved unsuitable because of lack of fuel and because the nature of the operation made mechanical mining impractical.

At this time it was considered uneconomical to process stones below about 200 grams in size. One day in 1943 Mr. Morris Hanauer, owner of American Gem and Pearl Co., a quartz importer, was trying to convince Lou Patla of DX Crystal Co. that he should use these small stones. "Lou", he said, "God made lots of small crystals but very few large ones. So why don't you go along with God and use the small ones." Soon ways were found to process the small stones with satisfactory results. This information spread quickly throughout the industry and for a time alleviated the quartz shortage.

Nevertheless, through the entire war period the quartz crystal industry lived on a hand to mouth basis and the shortage problem was eventually met, not so much by increasing the supply as by conservation. The yields were increased by making the blanks smaller and stones formerly considered unuseable were processed. Production records were maintained and with one or two notable exceptions, quartz was allocated only to the producers who could show that they were able to utilize it efficiently.

The lesson learned from the shortage of a critical raw material for which we were totally dependent on an offshore supply was not wasted. Efforts were made to find a substitute for quartz. These were unsuccessful but at the end of the war it was learned that Germany, faced with a similar quartz shortage, had made some progress toward making man-made quartz. Consequently a major effort was mounted to make cultured quartz with such success that we are now almost completely independent of the natural material.

The Ageing Problem

By the middle of 1943 the task of setting up an industry was complete and crystal units were being produced in numbers adequate

to meet the demand. It was then that the second, and even more serious crisis confronted the crystal program. Reports began to filter in of extensive crystal failures both in service and in depot storage. The first responses to these reports ranged between indifference and disbelief. However the reports became more persistent and the Signal Corps Engineering Laboratories (SCEL) at Fort Monmouth were requested to investigate the situation. The progress was slow because the problem was treated as an academic question rather than a matter of the utmost urgency. Late in 1943 a telegram was received at OCSIGO which changed the situation. It read as follows:

COMMUNICATIONS EIGHTH AIR FORCE BASED IN BRITAIN BROKEN DOWN LACK OF CRYSTALS

FIND CAUSE CURE SAME EAKER

Reception of this communiqué caused a flurry of activity at both the QCS and at SCEL. A test facility euphemistically named "The Swamp" was constructed at Camp Coles Signal Laboratory. It subjected crystal units to temperatures of 100 F° in an ambient relative humidity of 100% simulating the conditions reported from the Burma theatre. The tests quickly confirmed the field reports. All crystal units failed within a few days or at most a week or two. Some of the failures were due to the phenomenon of corrosion fatigue in which the ammonia released by the phenolic holders attacked the brass connectors at points of stress causing them to break. This problem was corrected by eliminating brass from the assembly. A much more serious problem was the ageing syndrome characterized by loss of activity and increased frequency. Many theories were advanced to explain the phenomenon and these had to be checked out experimentally. Meanwhile the manufacturers were producing crystal units at the rate of a million per month; nearly all of which were destined to be useless.

Before the end of 1943 it had become apparent that the most important factor in the ageing process was the surface of the quartz which was damaged in the process of lapping to frequency. Particles of quartz, partially loosened by abrasion, were further loosened by the effects of water vapor, eventually breaking away completely. The presence of these loose fragments on the surface of the blank reduced the activity by damping and their loss caused an increase in frequency because of the reduction of mass.

The problem of ageing was especially severe in the CR-1unit used by the Air Force because these units operated at higher frequencies and required closer tolerances. As a temporary measure orders were issued by Wright Field that all quartz plates must be able to withstand the test of scrubbing with soap and water and a toothbrush. Soon each Signal Corps Inspector and each crystal finisher was equipped with a toothbrush and a dish of soapy water. The directive was a boon to the toothbrush industry but contributed little to the solution of the ageing problem.

By the end of 1943 it had been shown that quartz blanks which had been etched to frequency exhibited very small changes of frequency and activity even when subjected to tropical conditions. However considerable opposition existed to the idea of etching and much valuable time was lost in investigating other approaches before the decision was made to require etching. This was due to a reluctance to specify a manufacturing process which might require rewriting of the specifications and renegotiating of contracts and to a wise policy of specifying test results instead of manufacturing procedures. Yet it was impossible to depend upon inspection procedures to insure that crystal units would remain useable and a vast amount of work had failed to reveal any other manufacturing procedure which would do so.

Consequently a Conference of all Crystal Manufacturers was called on July 11-12, 1944 in the old Stevens Hotel in Chicago. The problem was explained in detail and the proposed remedy was presented. There was no time to rewrite the specifications or to renegotiate contracts so the manufacturers were asked to convert their production processes from hand lapping to etching. It was expected that units made by the etching process might be more expensive. Again the industry rose to meet a challenge. The manufacturers went back to their plants and converted to the new process with such success that they produced satisfactory units at a lower cost. As one example, Ken Ross, who had converted his coil winding plant in Chicago to a facility for making FT-243 crystal units, designed and built a continuous etching system which, with four operators, turned out as many finished crystal units as 20 operators finishing by hand lapping. The Ross system was soon widely copied throughout the industry.

Ironically, the ageing problem might have been avoided had better communication existed. The phenomenon of ageing had been noted as early as October 1940 at RCA. The work of H. E. LeRoy and V. E. Trouant led to a Company Confidential memorandum dated April 14, 1941 in which they said:

"Etching... reduced the number of failures." and that "Etching will be incorporated in the processing as soon as details can be worked out and operators trained."

Unfortunately this work was unknown outside the RCA Laboratories until after the war and even there it does not appear to have been exploited.

To provide crystal units for special purposes in the field, twelve three-man crystal grinding teams were given a three months crash course in finishing crystal units. They were trained by Dr. D. G. McAA, a retired physician, at Camp Coles Signal Laboratory. These teams were provided with the necessary equipment and supplies and shipped to various theatres of the war. Upon arrival they found that many of the crystal units in depot stocks were useless and much of their time was spent in opening, cleaning and grinding thousands of crystal units to new frequencies. Mr. H. J. Benedikter, who is today associated with the General Electric Crystal Manufacturing Facility,

was a member of one of the original crystal grinding teams.

At home teams of GI's and civilians were trained to examine depot stocks of crystal units and to select out useable units which were often flown immediately to a war theatre. Later some attempts were made to salvage the defective units and at least one company, The Hudson American Co., was commissioned to do so. However most of the units were enclosed in phenolic plastic holders and many others contained brass contacts, both of which were considered unsatisfactory, leaving little besides the quartz blank to be salvaged. It soon proved to be uneconomical to salvage the units and ultimately millions of the unetched units were destroyed.

It may be worthwhile to examine the ageing episode; not to assess blame or responsibility but to see if, by doing so, we might avoid a similar debacle in the future. It appears that the ageing problem resulted from three basic mistakes; each understandable and perhaps forgivable. The first was to depend so heavily on an immature technology, the second was to disperse an industry so widely that it could not be properly supervised, and the third was failure to follow up with an adequate reliability test program. The recall programs of the United States automobile industry indicates that some of these lessons may not even yet have been learned.

Post War History of the Industry

It is difficult, if not impossible, to trace the histories of all of the firms which have been engaged in the business of manufacturing quartz crystal units. Only a few firms, notably Bliley, Monitor and Valpey still operate under their original (or similar) names and can show continuity of management. Most of the companies have either disappeared or have changed names and locations so many times that to trace their records is virtually impossible. It may be of some interest to trace the history of one company; noting that it is typical of the industry.

When Grover Hunt discovered that people were willing to pay for crystal units he formed a partnership with Linwood Gagne and they began to make crystal units in a small building adjacent to Gagne's home in Carlisle. In 1935 they formed Standard Piezo Co., the first crystal company in the Carlisle area. One of their employees was Wally Samuelson. In 1940 Hunt left to form his own company, the Hunt Corp. which is today Erie Frequency Control. At the end of the war Gagne sold Standard Piezo to a group of local business people headed by John Fowler. Later it was sold to Brown Oil Co. and Luther McCoy was made Sales Manager. In 1952 McCoy left to form his own company and Standard Piezo was sold to the Hupp Corp. which, in turn, sold it in 1958 to Herman Schall and Wally Samuelson who renamed it Piezo Crystal Co. In 1963 Schall and Samuelson sold out to the Renwell Corp. who sold it to the Sunshine Mining Co. The plant was subsequently sold to a holding company, Anchor Operating, Inc., which operates it today

under the direction of Charles Jensik.

It is interesting to note that the 1980 edition of the QUARTZ CRYSTAL INDUSTRY GUIDE AND DIRECTORY states that Piezo Crystal Company was established in 1938. In a sense this is true, but it is in the same sense that an antique axe which has had several new handles and a few new heads is still the same axe.

A list of manufacturers of quartz crystal units dated 1 May 1945 includes the names of some 130 companies. One year later the number had dropped to fewer than half this number. After revival of the industry during the Korean War approximately 50 companies were engaged in the business of making crystal units. The number decreased again when the Korean War ended but has increased again in recent years.

Today the industry includes between 50 and 60 companies employing about 6500 people. It is impossible to say how many are engaged solely in the manufacture of crystal units since many of the companies also produce items such as crystal filters, TCXO's and VCXO's and in addition some of them produce only blanks while others only finish blanks.

The typical company, if it existed, would have about 100 employees including two engineers but the size of the companies varies by two orders of magnitude. The largest companies, CTS-Knights and Piezo Technology employ 580 and 515, respectively. The two smallest, American Crystal Co. and Defco employ 6 and 3 persons, respectively. Several companies have fewer than 10 employees.

The foregoing figures do not include the firms which support the crystal industry. These are more numerous than the actual crystal manufacturers and employ more people. Among the products supplied by these firms are cultured quartz, holders and bases, abrasives, chemicals, silver and gold, electronic instruments and machine tools, and supplies in an almost endless variety.

Problems of the Crystal Industry

The wartime expansion of the crystal industry came to an abrupt halt with the end of the war. Contracts were cancelled, plants were converted back to civilian production and equipment was dispersed. The number of producers dropped from 130 to below 50 in a few months. When the Korean War came in 1950, bringing with it a new requirement for crystal units it was necessary to subsidize the companies to obtain the crystal units needed by the Armed Services.

For its entire forty years the quartz crystal industry has been plagued by the feast/famine cycle. In times of military rearmament the demand has escalated only to be followed by abrupt deescalation when the crisis was over. Until only recently the civilian requirements for quartz crystal units have been small compared with military requirements in times of crisis making

continuous production impossible.

One problem in the quartz crystal business has been lack of research and development. It is true that in the decade following WW II the Armed Services did support an R & D program which yielded some useful results. A notable example is the program which led to the development of a cultured quartz industry. But for the most part the results have not been effectively utilized; partly due to the fluid nature of the industry. Outside a few large companies, notably the Hewlett Packard Corp., very little work in quartz crystal technology has been supported with industrial funds.

The field of piezoelectricity has always been, and continues to be ignored by the Schools of Electrical Engineering. Quartz crystal technology has been treated as an art, or even worse, as black magic. With the exception of the students who have received formal training at Northern Illinois University under Dr. W. E. Newell and at Colorado State University and McMurry College under Dr. Virgil E. Bottom, most of the people in the industry have learned from one another going back to the handful of men who started the industry who had, themselves, learned in the School of Experience.

Academic neglect of the field is also shown by the dearth of literature available to the newcomer. The classic work of Cady, the books of W. P. Mason and the compilation of 1942 papers by Heising include practically everything which has been published in this country. The book publishers naturally have been reluctant to make the necessary expenditures to publish books for a nonexistent clientele.

The industry has had its share of "get rich quick" entrepreneurs who jumped at the opportunity to make a quick profit during times of emergency but these have been a very small minority. Most of the men who entered the crystal industry, particularly during the war, were motivated by the challenge of a difficult job and by the desire to make a patriotic contribution as much as by the profit motive. Many continued in the business as long as they were financially able to do so; often bidding on production contracts at prices below the cost of production in order to hang on a little bit longer. They have done so at great financial sacrifice to themselves and to the detriment of the industry.

The industry has always been too small to be of interest to Wall Street and the large corporations and technically too difficult for the small entrepreneur without adequate financial backing and scientific capability. In those instances where large corporations have taken over small crystal companies the results have been almost uniformly disastrous. Generally speaking, the management of the large companies have attempted to apply the same production management techniques which work successfully in the production of most standard components; failing to recognize the great complexity of the apparently simple crystal unit. When they have found out, they

have been unable or unwilling to make the capital investments needed to put the production of crystal units on a firm financial and technical basis.

The crystal industry has experi

That happened a few years back, perhaps partly due to the movie 'Memphis Belle'. Big Band/Swing music made a big comeback as evidenced by folks like Harry Connick Jr, Michael Buble and so on. AM 740 out of Toronto has a Big Band show every Sunday night from 8-11 IIRC.

And to Mark's comments on vinyl - a recent report showed that sales of vinyl hit its highest level since the early-mid 80s, this past year. No doubt related to so many kids discovering their parents' record collections.

There is certainly hope for the future of old radios too. All we need to do is provide the avenue, or opportunity to discover the high coolness factor.

the trouble with chemical etching is that it is difficult to be precise. the best way is to etch it to just below the required frequency, and lap the final amount.however it is nasty stuff to handle , and very unwise to have around where there are children. if you find an xtal just a small amount below what you want lapping as i described is far easier , and takes little time. cheers, alan

Thanks for sharing that, Dennis! I suspect that others on the list will find it interesting, too.

I remember that Swing comeback. Some of the resulting works were an interesting fusion of vintage big band plus other genres, such as an album that I got from the Brian Setzer Orchestra.

Interesting! When I learned that my favorite band (a progressive metal band; y'all probably haven't heard of them and wouldn't like them) was including a vinyl pressing in the boxed set for their latest album last year, it just didn't compute. I hadn't heard of the vinyl comeback yet.

Now, if 8-track tapes come back, then I'll know that the world is about to end. I don't think there's anything good to say about 8-track tapes. :)

On the topic of the rising interest in vintage AM at the same time as falling prices for radios, I suspect that the price dropping has a lot to do with the economy in general. My money and I are still soon parted, as the saying goes, but even I'm less prone to spend money on toys than I was when I was feeling the effects of the dot-com bubble.

Alan, et-al,

Well, I've done a fair amount of it both ways and prefer etching, all things considered. In the lapping process, microscopic grains of quartz become loosened that then slough off some time later while crystal is in operation thus raising the frequency slightly. This was discovered early in WW2 when large scale crystal production commenced, see the article attached to my previous e-mail. The frequency shift is small and not a big problem in Ham use when operating straight through on the fundamental frequency but IS a problem when multiplying 8X or more to get up to 2M (for ex) and I have experienced this personally with an SCR-522. Have also experienced no problems bringing a crystal up to just the frequency desired, the etching rate is relatively slow and entirely predictable with a bit of care. Also, it is difficult to move a crystal much more than a few kHz by hand lapping/grinding without suffering a loss in activity. Etching, on the other hand preserves the wafer's original, slightly convex shape and I have shifted crystals up-frequency as much as 20 kHz with no problems.

It would be interesting *if* true.

Putting gauge blocks on FT-171 crystals shows NO convex shape of them at all.

The are absolutely flat.

Have used several high precision measuring tools.

To that point, check out the article in this months QST about Tim Allen's new TV show "Last Man Standing", where he plays a character who's hobby is ham radio (KA?XTT) and who works for an outdoor sporting goods company. Ham radio fits into the story as a means of emergency communication, and the producer (NN6JA) not only made sure the Icom gear on the set is fully operational (there are 8 hams among the staff) but also told ARRL that he "plans to add vintage equipment to the shack in the future".

Sounds like coolness to me!

Try some ACTUAL measurements of the FT-171 series made for BC-610s.

*THEN* come talk with ACTUAL knowledge in hand.

Not simply antiquated "references".

Significant reality differences between reality and papers.

Just re-checked eight different FT-171s. NO convex shape to the flat side.

Only noticeable shape other than flat, are the edges. They are tapered
very slightly.

Ah,
As a clarification, I have the BC-614 in these "flavors",
Plain model Round meter, H model round meter, I model
Square and last but NOT least a plain model that has a "Line Meter"
it is square as well!
YMMV

Indeed! Any interest going forward is a plus. As with now, many folks prefer the newer technology, but I'd bet the hands-on types with be drawn to the older equipment. When I got interested, the FT-101 was the big deal rig of the day. I actually had one as my first rig simply because the price was right, but I later moved to a KWM-2A that was ten years older and worked ten times better, it seemed. From that point there was no end to the cool rigs waiting to find homes. So for me, even though there was a lot of 'better' aka newer technology out there, I was drawn to the old stuff. So it does work.

Thanks for posting this, Bob. I'd heard about its use in the show, but wasn't aware that there were several hams on staff!

Well, as I said - prices are still higher than they were 15 years ago when the 'net took off and ebay kicked in, and prime examples still bring a lot of money. But for every KWM2 you can show me over $1K, I can show you half dozen or more well under. Generally $400-$800. The hallowed SX-88 that brought $10K at its zenith has dropped considerably, too. Last time I checked QTH, there were 2 on there for $2K or so that hadn't sold. One was in pretty nice shape, the other wasn't too bad. Both would've easily brought double or more a few years back.

I've never considered ebay to be 'market' price anyway, generally more of a top-dollar/bigger audience opportunity. Prices are down at hamfests too. Reasonably priced stuff sells, ebay priced gear gets taken back home. I had a Harvey Wells TBS-50D for sale at a big fest last fall for $175, including the original power supply *and* original manual. I've seen the manuals bring $35 or more on ebay previously, the power supply $125+, and the transmitter $100-$250. I couldn't even get an offer, and it's a pretty clean unit overall. I'll try again at Frostfest in a few weeks.

Even T-368s are down from 4-5 years back. They are routinely for sale in the $600-$900 range lately, not the $1.5K-$3K they brought back then. I've seen a couple go unsold on ebay because the opening bid was $1K or more.

Though I do understand that left coast prices tend to be a bit higher than back east. That's probably always been the case.

Not sure if I'd classify it as a comeback yet, but certainly a lot more activity than in recent decades. Some of the platters available are astounding, multiple $K price tags that make our T-368s look like chump change.

> Now, if 8-track tapes come back, then I'll know that the world is about to

I spent a decade plus in gov't work involving mainframes, and was amazed when, back in the 90s, I strolled into a data center to find IBM 3480 & 3490 tape drives using what outwardly appeared to be a heavy duty 8-Track tape. Very similar design at least outwardly, still in use in later generations. Scary!

This clearly plays a role as well, less disposable cash on hand for toys. That combined with having accumulated so many projects in the last 20 years has put a screeching halt to my buying anything else unless it's a piece needed for the ARC-5, RAX, or other station projects. I'm focused more now on spares and items needed to finish what I have now, including the T-3. Still need to find the side chart pocket, the shock mount base, and a few other items to round it out. Finally got it making RF last April, so it should be back online as soon as I find time to deal with the flaky/jumpy PTO. The old maxim of too many projects, not enough time still applies.

Putting them back on the air plays a big part in giving others the opportunity to hear the fine signals this 'obsolete' gear can make, of course.

# 4995. FS: More HAM Accessories

Yahoo group: T-368_BC-610
Date: 2012-01-14 18:47:10 UTC
From: Bry Carling
Topic: 4995  Message: 4995

FOR SALE:

MFJ-812 VHF Wattmeter / SWR meter.
This is the worlds most popular and most affordable VHF SWR/Wattmeter.
It has a built-in Field strength Meter. Covers 144 and 220 MHz.
Read forward and reflected power in 2 ranges - 30 or 300 Watts. Reads SWR from
144 thru 220Mhz. Also reads relative field strength from 1 to 220 MHz. Has binding
post for field strength antenna. Measures 4.5 x 2.25 x 3 inches. Eggshell White.
Excellent appearance and in working condition.
Available for $24.00 plus shipping
(photo available)

RL DRAKE Low Pass Filter model TV1000LP rated for 1000 Watts up to 30 MHz, 52 Ohms.
Has the two standard SO-239 connectors for attaching coaxial cables. These typically go
for around $35.00 on eBay.
Available for $20.00 plus shipping
(photo available)

FOR SALE: Panel Meters - all in excellent condition except as noted.

Simpson Square Panel Meter model 37, 0 - 1 Amperes "radio frequency" .
Three inches square with traditional rounded corners.
QTY 1 available for $10.00 plus shipping.

Jewell Electrical round panel meter Pattern No. 66 for 0 - 1 Amperes "radio frequency."
Thermocouple type. Round 3.25" diameter for 2-1/2" hole.
QTY 1 available for $10.00 plus shipping.

Weston Electrical Instrument Model 425 for 0 - 5 Amperes RF.
Round panel meter with 3.5" diameter and uses a 2.75" diameter hole.
Since the outer case has a crack in it, the price is set
accordingly. Seems to still work fine though.
QTY 1 available for $3.00 plus shipping.

General Electric 0 - 50 mA DC meter, 3" X 3-1/8" square type with rounded corners.
QTY 1 available for $10.00 plus shipping.

Jewell Electrical panel meter Pattern No. 53. 0 - 10V DC. Round 3.25" diameter for 2-1/2"
hole.
QTY 1 available for $6.00 plus shipping.

General Electric Elapsed Time Meter for 120V AC. Reads Hours on a 0 -99999 scale.
Has already had 192 hours usage. This is a round panel meter - 3.5" diameter.
Uses a 3" hole. Since the outer ring of the case has a chip out of it, the price is set
accordingly.
QTY 1 available for $3.00 plus shipping.

Weston Electrical Instrument Model 301 Voltmeter, with scales for 0 - 140V and
0 - 7V DC
QTY 1 available for $5.00 plus shipping.

Weston Electrical Instrument Model 478 round panel meter for 0 - 5V AC.
with 3.5" diameter and uses a 2.75" diameter hole.
QTY 1 available for $8.00 plus shipping.

Triplett Model 321 round panel meter for 100 - 0 - 100 microAmperes DC, dual polarity.
Has center zero. 3.25" diameter for 2.75" hole.
QTY 1 available for $10.00 plus shipping.

Weston Electrical Instrument - Model 476 round panel meter- rear mount, no flange.
Scales for 0 - 60V and 0 - 120V AC. Has 2.75" outer diameter and 2.5" inside diameter.
QTY 1 available for $8.00 plus shipping.

Jewell Electrical panel meter Pattern No. 70. Round panel meter for 0 - 15V AC.
3.25" diameter for 2-1/2" hole.
QTY 1 available for $6.00 plus shipping.

This next one is a beauty - WESTERN ELECTRIC 0 - 1mA, MODEL ADK84 with scales for:
P.A. Plate 0 - 200 mA segmented as CW in the 80-120mA range and MCW in the 120 - 200 mA range. Also has a scale in the center for P.A. Grid and Battery.
Has 2.75" diameter and uses a 2.25" diameter hole.
QTY 1 available for $15.00 plus shipping.

Jewell Electrical Company dual scale meter for 0 - 12V DC and 0 - 120V DC.
3.75" diameter for 3" hole. The case looks fine but has a small chip out of the glass, and the so price is set accordingly.
QTY 1 available for $3.00 plus shipping.

Combine to save on shipping. Thanks for looking.

73 de AF4K, Bry

# 4998. FS: 807 Tubes

Yahoo group: T-368_BC-610
Date: 2012-01-16 12:34:50 UTC
From: Bry Carling
Topic: 4998  Message: 4998

FOR SALE: 807 Tubes etc.

Standard shoulder style 807 tubes - most of these are used, tested good tubes.
Some may be new but are unboxed. One NOS, boxed.

QTY 4 - 807 Raytheon Holland $10.00 each plus shipping

QTY 1 - National 807 - $10.00 plus shipping

QTY 2 - General Electric 807 - $10.00 plus shipping

QTY 1 - RCA 807 - $10.00 plus shipping

QTY 1 - CBS 807 - $10.00 plus shipping

QTY 1 No name 807 - $8.00 plus shipping

QTY 9 - Type 5933 / 807W ruggedized tubes.
Available for $10.00 each plus shipping

QTY 1 - New in BOX JAN/General Electric 807 - $15.00 plus shipping
QTY 3 - RCA VT-136 / 1625 Tube for $6.00 each plus shipping
QTY 1 - National VT-136 / 1625 Tube for $5.00 plus shipping

Shipping additional on all the above.

Thanks for looking and 73 - Brian Carling, AF4K

# 4999. FS: Antique NOS, 4-pin tube sockets etc. etc.

Yahoo group: T-368_BC-610
Date: 2012-01-18 22:54:45 UTC
From: Bry Carling
Topic: 4999  Message: 4999

FOR SALE: New Old Stock (NOS) tube sockets and a nice MIC cable

Single large, flat contact, Ceramic 4 pin socket NOS.
Outer diameter abt 3.5" with metal bayonet for approx 1.75" diameter tube base.
Presumably for 211 type tubes, best that I remember.
QTY 2 NOS sockets available... picture here:
http://www.af4k.com/imag/ham/Single_4pin_socket.jpg
Will sell for $6.00 plus shipping

Pair of large, flat contact, ceramic 4 pin sockets NOS.
Outer diameter abt 3.5" with metal bayonet for 1.75" diameter tube base.
Presumably for 211 type tubes, best that I remember.
QTY 2 NOS sockets available... picture here:
http://www.af4k.com/imag/ham/Two_ceramic_4pin_sockets.jpg
Will sell the pair for $12.00 plus shipping

Single Ceramic Bayonet Socket, NOS, smaller. BIRNBACH No. 435.
Outer diameter 2.5" with metal bayonet for approx 1.25" diameter tube base.
QTY 1 NOS socket available... (two more of the same below) picture here:
http://www.af4k.com/imag/ham/Single_ceramic_bayonet.jpg
Will sell for $6.00 plus shipping

Pair of Ceramic Bayonet Sockets by NATIONAL CO. (NC logo), NOS.
Outer diameter 2.5" with metal bayonet for approx 1.25" diameter tube base.
QTY 1 NOS socket available... (same size as single one above) picture here:
http://www.af4k.com/imag/ham/Two_ceramic_bayonet_sockets.jpg
Will sell for $6.00 plus shipping

Group of FIVE NOS Bakelite, 4-pin Tube sockets - unused.
These are all made for 4-pin sube sin various styles. Two have bayonet
fittings, the other three do not. These are great for breadboard construction or
for repairing antique radios.
Picture here:
http://www.af4k.com/imag/ham/4-pin_Tube_Sockets.jpg
Will sell all five as a group for $15.00 plus shipping

Microphone Cable assembly for older ham transmitters - with classy, in-line Binding
post/Banana jack connector. Shielded cable is 36 inches long. Looks new. See
pictures here:
http://www.af4k.com/imag/ham/cable1.jpg
http://www.af4k.com/imag/ham/cable2.jpg
Available for $5.00 plus shipping

Antique Dual Bakelite connector assembly NOS. Dimensions 2-7/8" X 2-5/8"
Has two 4-pin receptacles, and one plug. Mounting holes. Model 14213-6 unused.
Photo here:
http://www.af4k.com/imag/ham/dual_socket.jpg

QTY 1 available for $5.00 plus shipping

QTY 1 James Millen Co. type 37303 ceramic 3-way terminal strip. For connecting external wiring.
Lightly used and in excellent condition. Dimensions 2.25" X 0.5" - there is nothing quite like
these for a professional finish to any receiver or transmitter.
Photo here:
http://www.af4k.com/imag/ham/millen_strip.jpg
QTY 1 available for $5.00 plus shipping

QTY 1 - Right Angle Drive assembly. Military Surplus type MC-203-A Dual 90 degree, 3-way, antique drive assembly, with small gears inside.
Black wrinkle finish. Looks like 3 type N connectors but if you look inside there are gears.
NOS. Base dimensions 2.5" X 2" and the connectors each protrude 9/16"
Has two 3 threaded receptacles, and has four mounting holes. New and unused. Also stamped AC58139 underneath. Does anyone know what equipment this is from?!
Photo here:
http://www.af4k.com/imag/ham/MC-203-A.jpg
QTY 1 available for $4.00 plus shipping

I still have just a few 807 tubes left if anybody needs them.

73 & thanks for looking - Bry, AF4K

Guys, I just pasted a photo into this email using my iPad to see it it goes through. This is a photo of the meter I have and mentioned. I have no idea what equipment it came from. The lower glass isn't flat across the bottom like most Hallicrafters meters, it has the raised center and only raised lines on either side of the adjustment screw.

Bob I will send a photo to the moderator. I sent an email to Chuck Dachis along with a photo. He wrote back stating the the meter case was identical to the meters on his HT-4B and that it may be from a HT5-B speech amp. He did say it was rather unique.

Hi All,

I have a manual here for the "Radio Transmitting Set Type EP 134", which I think is a (just) pre-WWII manual for the commercial version of the HT-4, sold as a complete station with an SX-28. It covers the HT-4B, HT-5B and the AT-2, frequency coverage of the EP 134 is 2-8 Mc. There is a clear photo of the HT-5B Speech Amplifier and the meter is calibrated in dBs, the circuit diagram shows the meter as being across the secondary of the AF output transformer in series with a factory-sealed pot. I can scan this image if required.

I should have added that in "The Voice of Victory", the HT-5 can be seen with the meter dropping to zero between speech peaks. The film quality is too poor to discern the meter label but it does look like "Decibels".

> I have a manual here for the "Radio Transmitting Set Type EP 134", which I think is a (just) pre-WWII manual for the commercial version of the HT-4, sold as a complete station with an SX-28. It covers the HT-4B, HT-5B and the AT-2, frequency coverage of the EP 134 is 2-8 Mc. There is a clear photo of the HT-5B Speech Amplifier and the meter is calibrated in dBs, the circuit diagram shows the meter as being across the secondary of the AF output transformer in series with a factory-sealed pot. I can scan this image if required.

Antique Electronic Supply lists them for US $214.80, so I'd call that the upper price limit for a NOS tube.

The one and only concern is how it is shipped.

Many of these old fire bottles are ruined by folks that do NOT properly pack and ship them.

I would think that the one vendor provided as a price point, is VERY aware of what it takes! They indeed provide a LOT of tubes across the spectrum of those that seek them out.

From: Roger Basford
Topic: 5009  Message: 5013

Ummm! Shipping big tubes can be a nightmare. I had a NIB 250TH shipped from Manchester to Norfolk, about 225 miles by road, and the Royal Mail managed to completely dismount the electrode structure whilst leaving the envelope intact. The valve was in the original box and was further very well packed inside another box. I'd paid 80 GB pounds for that tube, so that was wasted, but fortunately the seller had another and sold it off ebay to keep my costs down.

When I wanted a pair of 100THs, the seller in Holland got a family friend who was coming over to the UK to hand-carry them and I picked them up in the London area.

It gets worse; a couple of years ago, I sold a pair of Western Electric 248D tubes to an audiophile in Texas. Although I (at his request) arranged very expensive tracked and signed-for shipping and double-packed the tubes he still came home from work to find the package dumped on the doorstep, unsigned for, and the anode connection in one tube broken off inside the envelope. I refunded his payment and claimed against the courier, eventually getting almost all the money back, but I am very reluctant to ship big tubes nowadays.

My advice to you, Alan, would be to see if a family member, friend or colleague who travels to the States might be prepared to hand-carry one for you. Might have some fun at airport security if their bags get searched!!

Just my two-pence-worth.

Roger/G3VKM

# 5015. It Lives!

Yahoo group: T-368_BC-610
Date: 2012-01-23 03:49:17 UTC
From: Mark J. Blair
Topic: 5015  Message: 5015

After replacing my 4-125A modulator tubes with a NOS pair or Eimac tubes from Antique Electronic Supply, my T-368C modulates properly and it's back on the air! I used it on the West Coast MRCG net last night, and it worked great, without any hiccups.

I still have plenty of fun planned for it; I'm building an interface box to plug into the rear panel remote control connector, with a balanced input to the 600 ohm line and break-outs for the PTT, receiver disabling, and CW sidetone. I plan to play with outboard audio processing to see how good I can get the transmitted audio to sound without any internal mods; this is my compromise between wanting to learn about and experiment with audio processing for better AM sound vs. wanting to leave my transmitter's innards original. I also have an R-390A that needs a bit of work, and a good bit of work ahead of me to integrate the R-390A, my (unrestored and untested) CV-591A, a CV-116 that I've arranged to pick up next May, and the MD-239A that came with my transmitter. I've picked up an LS-206 speaker for the receiver and SSB converter, and various equipment including a Symetrix 528E voice processor that I'll experiment with for outboard voice processing. I'm planning to build a sampler probe for the RF output, and I have an OS-8C oscilloscope that I'm going to try using as a dedicated modulation monitor, preferably configured for a trapezoidal display.

Thank you all very much for the help you've provided so far towards getting my old beast back on the air. It's been really satisfying to get this transmitter working again.

# 5018. FS: Allen-Bradley Pot Assortments etc.

Yahoo group: T-368_BC-610
Date: 2012-01-23 15:41:06 UTC
From: Bry Carling
Topic: 5018  Message: 5018

FOR SALE: Allen-Bradley Pot Assortments

While I could never be accused of selling pot, I do have a large number of good potentiometers to sell. Most of us kno wthat Allen-Bradley makes som of the very best potentiometers ever.

Most of these are new, USA made items, several are removed from working equipment.

POT ASSORTMENT #1 - Mostly TYPE J and TYPE P.
QTY 55 A-B pots, maybe a couple of Ohmite that look jusy the same. All 1/4" shafts. Many full length. Some are trimmer length. Includes 250, 1K, Dual 1K, 3.5K, 5K, 10K, 15K, 25K, 250K, 1.0M, 1.5M, Dual 10 M - total of 55 potentiomeneters available for $25.00 plus shipping.

POT ASSORTMENT #2 - Mostly TYPE J and TYPE P.
QTY 55 A-B pots, a couple of them are Ohmite. All have the standard 1/4" shafts. Many full length. Several are trimmer length pots. Includes: 50, 1K, 10K, 50K, 100K, 250K, Dual 500K full shaft, Dual 500K shorter shaft, 1.0 M, 2.5 M, 5 M, 10 M - total of 55 potentiomeneters available for $25.00 plus shipping.

POT ASSORTMENT #3 - Allen Bradley Type J yellow plastic pots with 1/4" shafts.
QTY 7 A-B pots with 200 ohms
QTY 3 A-B pots with 1000 ohns
QTY 2 CTS 250K pots New in Box pots with long 1/4" shafts
QTY 1 Centralab 1000 Ohms, new in box, long shaft, mix of new and used.
Total of 13 potentiometers available for $8.00 plus shipping

POT ASSORTMENT #4 - Precision multiturn pots - Bourns, Spectrol and Clarostat.
QTY 12 total, including 1K, 10K, 20K and 100K pots, mix of new and used.
Total of 12 potentiometers available for $8.00 plus shipping

POT ASSORTMENT #5 - QTY 18 slider pots - nos, audio faders by Stackpole, Dale etc.
QTY 5 X 10K
QTY 5 X 20K
QTY 5 X 30K
QTY 3 X 100K
Total of 18 potentiometers available for $9.00 plus shipping

NON-Allen-Bradley potentiometer asortments -

POT ASSORTMENT #6 - QTY 30 Various brands of potentiometers, mix of new and used.
Some dual pots. All 1/4" shafts, mostly full length. Includes values such as:
1K, 25K, 100K, 1 M, 5M etc.
Total of 30 potentiometers available for $12.00 plus shipping

POT ASSORTMENT #7 - QTY 30 Various brands of potentiometers, mix of new and used.
Some dual pots. All 1/4" shafts, mostly full length. Includes values such as:

1K, 25K, 100K, 1 M, 5M etc.
Total of 30 potentiometers available for $12.00 plus shipping

Please don't ask me if these are audio taper (logarithmic) or linear taper (I have NO idea!)
Also - please don't ask me if I have specific pots. I don't really have a way to hunt for them.

Contact me off the list to arrange purchase.

Thanks & 73 - Brian, AF4K

I tend to think that in -most- applications, 5R4's, 5U4s, 5Y3's can, to some extent, be interchanged, depending on the application. So, I went and checked the differences between the 5U4 and the 5V4...

5V4-GA Ratings
Vh Ih VaMax IkMax Notes
5.0 2.0 PIV=1400V 525 Ia pk Tube drop = 25V @ 175mA

5U4 Ratings
Vh Ih VaMax IkMax Notes
5 3.0 PIV=1550V 800 Tube drop = 44V @ 225mA DC

Except for the larger tube drop (how much voltage drops across the anode/cathode junction) it looks to me like the 5U4 would be a better fit. I'm thinking this is the 'low voltage- supply, for say, the 807's. As far as the '610 is concerned I would have to imagine that a few things are going to be ok...
1) filament current - typically these military transmitters were built to mil-spec, which has a 50% safety factor built in. If the circuit requires 2amps, mil-spec says make 4amps available.
2) the larger tube drop reduces the B+ on the plates of the 807's from ~550 to ~525v. Is that enough to affect the grid drive to the 250TH? IMO, probably not.
3) the added 150v in PIV wont hurt
4) neither will the current handling capability.

Shove one in, if you've got it.

73 = Best Regards,
-Geoff/W5OMR

hello guys , well , i have found out that the VT145 is a 5U4 on a UX base. this is a 5Z4 . i may have one , but they should not be too hard to find. my other thought is R11 . when i moved it there sounded like some contact to ground through the mounting bracket . i will insulate this and try again. i cannot imagine ever getting bored and running a BC610 ! alan

I'm afraid that I have to disagree. In the first place, 2 additional amps would be 100% safety factor, not 50%. In the second place, Mil Spec doesn't automatically mean 50% CCS safety factor. In the third place, why are you looking for a 5V4? The two LV rectifiers in the BC-610 are 5Z3's, which are electrically but not mechanically interchangable with 5U4's. Unless the tube sockets have been changed to octals, in which case the correct substitution would have been 5U4's, not a 5V4's.

Alan,

I should have a spare 5Z3 in my '610 spares, let me know if you are in need of one. Are you sure the bias rectifier is actually duff though?

# 5036. Re: 610

Yahoo group: T-368_BC-610
Date: 2012-01-29 16:56:19 UTC
From: Roger Basford
Topic: 4367  Message: 5036

Alan,

Have you changed the PA valve, the 250TH? I know you were talking about it and if you have then the manual says you need to check the neutralisation of the stage. However, as you have a steady 50ma of PA current it would be a good idea to check the bias voltage on the PA grid, which the manual says should be 110V DC from grid pin to chassis. If the voltage is wrong it is adjustable by slide pot R11 located on the top of the modulator deck on the BC-610-E. I recommend you follow the procedure in TM 11-826, page 97 to check the supply.

Hope this helps,

Roger/G3VKM

WELL ! the old girl is going fine now . the bias trouble was R11 as i suspected. it had rotated and one contact where the wires attatch was touching a mounting bracket. once this had been fixed no problems . about 5 amps of current into 10 feet of wire stuck into the antenna base . it has been a long time. i believe that the bias failure may have been the cause of the series resonance which destroyed the choke in the first place. anyway , now there is a much better PA tuning cap , choke , R9 , and C28 . they look like new. all i have to do is to get up on the roof of the tank shed , drill a hole in the riight place , and fit a feed through insulator . the 40 ft wire can then be fixed .i will do something similar for the rx antenna .the BC342 is all that needs to be done after that .i must say that the blower heater in the shelter has been a godsend in the cold weather. it really does warm it up. i often wonder if the guys who operated it are still around , and what they would think of it. if anyone needs a PA RF choke, i have 2 , and also the tuning capacitor. if nobody wants it i will put it on ebay in the end . cheers, alan

No. As I said earlier, it is a 5Z3. It looks just like a 5U4G but has a
4-pin instead of an octal base. A 5Z4 is a metal tube, VT-74.

Alan,

If you still suspect the tube, swap the bias and LV rectifiers. My guess would be that the problem is somewhere else, though.

FOR SALE: ELECTROLYTIC CAPACITORS

Mix of radial, axial, upright can etc. - some are NOS.  Most are new.
(a few are be good, used tested caps)

BOX #1  =  QTY 35 electrolytic CAPACITORS
QTY 2,  0.068 uF at 630 V
QTY 2,  0.056 uF at 630 V
QTY 1,  4 uF at 600 V
QTY 2,  8 uF at 450 V
QTY 1,  8 + 8 uF at 450 V
QTY 2,  16 uF at 450 V
QTY 1,  125 uF at 450 V
QTY 1,  10 + 10 uF at 450 V
QTY 2,  820 uF at 450 V
QTY 1,  40 uF at 450 V
QTY 1,  68 uF at 400 V
QTY 4,  220 uF at 400V
QTY 2,  33 uF at 400V
QTY 1,  40 + 20 + 10 uF at 350 V
QTY 1,  22 uF at 350 V
QTY 1,  10 uF at 350 V
QTY 1,  100 uF at 250 V
QTY 1,  100 uF at 200 V
QTY 1,  4700 uF at 35 V
QTY 1,  4.7 uF at 35 V
QTY 2,  2200 uF at 25 V
QTY 4,  100 uF at 25 V
Total of 35 excellent capacitors for $29.00 plus $12.00 shipping

BOX #2  =  QTY 40 electrolytic CAPACITORS
Mix of radial, axial, upright can - some NOS. Almost all are new.
QTY 2,   0.068 uF at 630 V
QTY 2,   0.056 uF at 630 V
QTY 1,   16 uF at 600V
QTY 1,   0.47 uF at 600V
QTY 2,   47 uF at 450 V
QTY 1,   20 uF at 450 V
QTY 1,   10 + 10 uF at 450 V
QTY 3,   82 uF at 400 V
QTY 5,   220 uF at 400 V
QTY 1,   33 uF at 400 V
QTY 3,   0.47 uF at 400 V
QTY 1,   22 uF at 350 V
QTY 1,   3 uF at 350 V
QTY 1,   47 uF at 250 V

QTY 1,   33 uF at 250 V
QTY 1,   270 uF at 200 V
QTY 1,   100 uF at 200 V
QTY 1,   1 uF at 200 V
QTY 1,   1000 uF at 50 V
QTY 2,   2200 uF at 35 V
QTY 1,   4.7 uF at 35 V
QTY 1,   1000 uF at 25 V
QTY 5,   100 uF at 25 V
QTY 1,   2200 uF at 16 V
Total of 40 excellent capacitors for $29.00 plus $12.00 shipping

BOX #3 = QTY 30 electrolytic CAPACITORS
Mix of radial, axial, upright can - some NOS. Almost all are new.
QTY 2,   0.068 uF at 630 V
QTY 2,   0.056 uF at 630 V
QTY 1,   16 uF at 600 V
QTY 1,   125 uF at 450 V
QTY 1,   30 uF at 450 V
QTY 1,   20 uF at 450 V
QTY 3,   16 uF at 450 V
QTY 4,   20 + 20 uF at 450 V
QTY 8,   220 uF at 400 V
QTY 3,   270 uF at 400 V
QTY 1,   82 uF at 400 V
QTY 1,   33 uF at 400 V
QTY 2,   1500 uF at 250 V
Great group of capacitors for a low price.  $29.00 plus $12.00 shipping

FOR SALE: hc6/u crystals for the amateur radio bands.

These are for Hallicrafters radios:

5.0 MHz, 6.0 MHz, 6.5 MHz, 7.0 MHz, 7.5 MHz, 8.0 MHz, 8.5 MHz, 9.0 MHz, 10.0 MHz,
11.0 MHz, 12.0 MHz, 12.5 MHz - Available for $16.00 each plus shipping.
(others available = inquire)

These are available for Drake 4 Line radios:
12.6 MHz, 13.6 MHz, 14.1 MHz, 14.6 MHz, 17.1 MHz, 17.6 MHz, 18.1 MHz, 19.1 MHz,
19.6 MHz, 20.6 MHz, 20.8 MHz (Drake recommended for 30m band), 22.1 MHz,
22.6 MHz, 29.1 MHz, 31.6 MHz, 32.6 MHz, 35.6 MHz, 38.1 MHz, 39.1 MHz, 39.6 MHz,
40.1 MHz, 40.6 MHz, 43.6 MHz

These are available for Drake 2 Line radios:
13.5 MHz, 17.5 MHz, 24.0 MHz, 24.5 MHz, 25.0 MHz, 30.0 MHz

Collins: Most are now available including 10.5775 MHz, 13.155 MHz, 13.9775 MHz,
15.7275 MHz, 15.8275, 15.9275 MHz and many more.

Others available: (many more also)
1000 kHz, 1400 kHz, 1600 kHz, 1700 kHz, 5355 kHz, 5360 kHz, 8998.5 kHz, 9.0 MHz,
10.0 MHz, 10.7 MHz, 15.0 MHz, 15.2 MHz, 16.0 MHz, 18.0 MHz, 20.0 MHz, 21.0 MHz,
21.1 MHz, 21.5 MHz, 27.0 MHz, 28.0 MHz, 30.0 MHz, 30.52 MHz, 32.0 MHz,
33.52 MHz, 34.5 MHz, 34.7 MHz, 35.0 MHz, 35.5 MHz, 36.0 MHz, 38.0 MHz, 42.5 MHz,
43.0 MHz, 43.5 MHz,

Most of the above are available now for $16.00 each plus shipping.
(some of the non-amateur-band Collins ones are $12.00 each)

For details see:

FOR SALE: NATIONAL RADIO CO. Variable Capacitor 110pF + 110 pF

This is a split stator 220 pF variable capacitor that can be configuered either for 220 pF or
two sections of 110 pF each. Looks to be good for around 3 kV or more.

Ceramic frame measures 6" X 4" X 3-1/2" and has a standard 1/4" shaft that is 1-1/2" long.

QTY 1 available for $22.00 plus shipping

(I have flexible, insulated 1/4" couplings if anyone needs some!)

# 5050. US domestic plug pin-out?

Yahoo group: T-368_BC-610
Date: 2012-02-23 12:18:26 UTC
From: Roger Basford
Topic: 5050  Message: 5050

Hi All,

Just a general question about the plugs and sockets used in the US for everyday appliances.

On a 3-pin plug, the type with two vertical pins and a ground pin, viewed from the rear, i.e. the side where the wires connect, which of the vertical pins is live and which neutral? In the UK, a 3-pin plug for the same purpose would have live to the right and neutral left, although of completely different design.

On the US plugs I have (some of recent manufacture) there isn't a marking on the pins or body, apart from a "GR" tag on the ground pin.

Thanks

Roger/G3VKM - Norfolk, England

I thought 'www' stood for "world" wide web (heavy emphasis on the 'world').

First link Google coughed up was:
http://inspectapedia.com/electric/0506s.jpg

Should answer all questions.

Thanks Geoff,

Looks like the live and neutral are transposed from our plugs, I'll print that sketch out for the shack notice-board!

# 5058. Re: T-368C Appraisel N8LKA Transmitter

Yahoo group: T-368_BC-610
Date: 2012-03-08 22:33:02 UTC
From: Glen Galati
Topic: 5057  Message: 5058

Hello Gary, aka, N8LKA,
I will be happy to give you an honest (no charge) estimate of your T-368 Transmitter. I used to have one, but my wife convinced or begged me to sell it to a close friend, so she could have more room in the basement where the Ham Shack was located. :<(, but it did bring her and my friend much happiness.  I was a Ground Radio Communications Technician in the Air Force for 22+ years (7/61-11/83.  And, I had a great love for working on anything electronic. To my still "GREAT LOVE", I do collect equipment and radios that I worked on.  Besides my basement, I have a store (1650 Sq feet of my 12,000 foot building filled with parts and equipment plus some communication and microwave portable shelters.  If you go to TheBunkerofDoom.com website you will see some 125 pictures that were take last year of ourr main and secondary store by this gentleman fro Dallas,Tx.  Just scroll down to his Travels to Surplus haunts on the West Coast.
I did or was a part of overhauling three T-368's in Germany for our GATEWAY Teletype  network at Rhein Main AB  back in the 70-72 time frame.  We had received 5-8 transmitters from all over Europe/UK to evaluate.  The excess was either given to MARS or turned-in to R&M.
Please let me know the condition, and the last time you had this unit ON-THE-AIR? Also, any and all pictures would be most valuable of interior, exterior, plus condition of the paint, and oxidation, corrosion, rust, and any broken items including bolt threads on the rear filter area. Does it have the original metal screen air filter with with the steel cover that fas twist thumb nuts?
Are there any modifications, holes drilled, and does it have the bottom shock mount base?  Is it castered for convenient movement?
I had $850 invested in my T-368C/URT which I appraised at  8 - 8.5 on a scale of 1-10.  Mine came with an extra power supply deck and an extra H.V. XFMR for that amount.

Hope I can be of help.

Yep, I was gonna say $800-$1500 seems to be the ballpark. If it's complete, in good shape, and working properly it'll bring a price more to the high end, of course.

I bought my T-368E about 15 years ago from Fair Radio for $650 plus $150 shipping. The transmitter was depot refurbished, retubed, tested and boxed (at Pirmasens, Germany) according to the paperwork that was attached to it - before going into storage prior to going for surplus.
I still have it and plan to keep it for a long time...

Topic: 5057  Message: 5063

Got mine from W1DEC in 2006, a D model. Dave/DEC, Mike/W1RC and myself were all looking for a T-368 in our home state of VT about 10 years back or so. Mike had one of the Fair Radio refurbs given to him by a fellow who had purchased it, stored it at his mother's house, then went back to school and lost interest. It was destined for the dump when someone at a club meeting remembered Mike as a boatanchor type and gave him a call. The three of us picked it up one afternoon in total awe.

Dave got the D model shortly thereafter from a fellow in RI. IIRC, he paid $1000 for it. It developed a HV short somewhere or somehow that would trip the breaker with a load BANG anytime you tried to energize the plate circuit.

Life got busier and I never found one, had more or less stopped looking. At my wedding in 2006, Dave came up to me at the reception to inform me that he had a gift for me. He was retiring and moving south to RI, and was giving me his T-368D. Quite a gift! The wedding was in Tampa, but needless to say - it was one of the first things I took care of after returning home to VT.

After moving south myself in 2008 to the state north of Meir, I finally got around to playing with the D model last April when my friend Steve K4HX was visiting. We managed to get it making RF just fine (no idea what the previous problem was), although the transmit frequency jumps around every time the transmitter is keyed. Sounds like the PTO in the exciter unit needs a little attention, hopefully soon.

That's my story and I'm stickin' to it. If anyone has a spare side chart pocket or shockmount base, I'd sure like to take them off your hands.

Are you certain that it is a BC-939 or TN-339/GRC-26? TMC made one or two similar sized tuners. Although the one I've seen has two meters on the front instead of one.

OK. Somewhere (from several years ago), I have some photos of a batch of modifications DOD or DA had done to the T-368 and the TN-339. As best I recall, the transmitter and the tuner got new nomenclatures. But I cannot recall what the nature or purpose of the modifications were. If I turn them up and the tuner has an insulator on the rear, I'll let you know.

# 5070. High voltage arcing debug

Yahoo group: T-368_BC-610
Date: 2012-03-25 22:48:04 UTC
From: Mark J. Blair
Topic: 5070  Message: 5070

I've had my T-368C off the air for a while because it has been overloading and tripping the B+ and/or filament breakers in operation. It seems to be more prone to do this when the weather isn't dry, so I suspect a high voltage arc when the air has a bit of moisture in it.

I picked up a digital insulation resistance tester via eBay, which can test at 500, 100, 2500 or 5000 volts. My high voltage probe tells me that it runs a bit higher than the rated voltage, i.e. around 5200V on the highest range. Note that it supplies negative voltage with respect to ground. I've been using it to energize various high voltage nets inside the rig, with the drawers removed and parts of the circuits disconnected where necessary. My chassis wiring is an open circuit to ground at 5kV. The power supply drawer nets show around 4G ohms to ground with the B+ caps disconnected so I'm not putting 5kV across them, and the modulator deck nets show around 500M ohms with the ground connection of the big bleeder resistor temporarily opened. I haven't checked the B+ caps for breakdown at high voltage yet.

Things get more fun in the RF drawer, though. I heard some arcing at 2500V when I powered up contact E3, the lower high voltage contact at the rear of the deck. After pulling V1 and V2 (the PA and clamper tubes) I didn't hear the arcing, which makes me think it was internal to one of the tubes... and hopefully, I didn't damage either of the tubes by doing this. However, when I turn up the voltage to 5kV (with the tubes removed), I get arcing underneath the V2 socket from pin 2 to the adjacent ground tab on the socket. This may not be the cause of my overloading problem, but it still seems suspicious. I notice that the connection under the chassis between the PA screen and the clamper tube (the net that I'm charging up in this test) is made with ordinary hookup wire through the wiring harness, which seems odd for a net that can see some high voltage. Maybe I don't understand how that net works in operation, though, where the tubes are warmed up before B+ is applied. I know that 5kV is a lot higher than normal operating voltage, but I'm looking for the weak link(s) in the high voltage wiring and insulators.

I don't think that this particular under-socket arc is my main problem, but I'll still clean up the crud on the socket bottom and bend that ground tab a bit farther away.

I haven't found any other obvious HV wiring problems yet, including where the HV wires pass through the chassis. I've been poking and prodding those wires with my shorting stick while under test to help find any weak spots in the insulation.

Does it sound like I'm on the right path to locate my suspected arcing path? Can y'all see anything wrong with the way I'm approaching this?

Mark,

Sounds like your PS and Mod decks OK. As I recall your problem was only under modulation and the caps in the PS are running at the same voltage (2500) whether you're talking or not.

In the RF deck, contact E3 runs through an 80K resistor (R4, the big job on the top of the chassis) over to the clamp tube and also to the screen grid of the 4-400. In normal operation the clamp tube is does not conduct, being biased to cut-off by the grid bias developed across R1 and R2 in the grid circuit if the 4-400. The screen grid in the 4-400 draws current, though, which causes a voltage drop across R4 down to about 300 volts, the normal operating range for the screen of a 4-400. If RF drive to the 4-400 is lost, the clamp tube conducts dragging the screen voltage down even lower to a point where the 4-400 plate will only draw about 140ma or 350 watts. All goes into making heat in the tube and not RF but is within the dissipation rating of the 4-400 and it can run all day at that way without destroying itself. The T-368 runs just that way in the CW mode, BTW. Keying is done back down the RF chain and the PA is left to take care of itself.

Now, when you applied 2500 volts to E3 with the tubes off, no current was drawn by either the clamp tube or the 4-400 so the full 2500 was applied to the plate cap and pin 2 on the clamp tube and also to pins 2 and 4 on the 4-400 socket. i would suspect the arcing you heard at that point was happening inside or in the base of the clamp tube where the leads are rather close together. May or may not have damaged the tube. When you pulled the tubes, no problem until you reached 5KV at which point the spacing on the socket pins was not enough. Not the problem you're chasing, though, because in normal operation the voltages at those points don't get anywhere near that high.

Doesn't appear you have put the juice to terminal E1yet. That would stress the circuit over to the plate of the 4-400, M3, C10, etc., and also a pair of feed-through insulators, both of which I have had to replace i my Basic. Would also recommend checking the HV wiring between the drawers in the cabinet.

Hope this helps.

Dennis

If I recall correctly, it happens after key-down, but I don't recall that I had to talk to make it pop. I may do some more power-on testing to determine more about what's failing if I can't turn up an obvious problem with the megger.

> In the RF deck, [...] Not the problem you're chasing, though, because in normal operation the voltages at those points don't get anywhere near that high.

Thanks for the great description! Yeah, that arc-over isn't my problem. I'll still clean the socket and bend the ground tab for good measure.

I've done E5, the antenna contact up on top. No problem seen, but I'll give it more attention.

Clean, clean, clean, look for cracked insulators, carbon tracking, cracked wiring insulation, etc.

Cracks in the wire insulation may be hard to spot.

Don't forget to clean the china and silver, too.

Joe

Mark,

Is the end-result that the HV breaker trips? Do you have a problem upon key up/dead carrier/heavy modulation?

First thought is that there is a weak spot in the tank circuit where a bracket is a too close to one of the coils. Others may be able to tell you specifically where this is as it seemed to be a common issue.

Tom

Usually the HV breaker trips, IIRC. I seem to recall that it happens on dead carrier. So far I haven't found any carbon tracks on insulators, or any cracking of the HV wiring. Testing at around -5200V with my insulation resistance tester hasn't found any issues yet.

Maybe I'll fire the Tx back up this weekend to see how it's behaving...

> First thought is that there is a weak spot in the tank circuit where a bracket is a too close to one of the coils. Others may be able to tell you specifically where this is as it seemed to be a common issue.

I'll look there some more. I haven't been able to recreate the problem at -5200V DC, but maybe the arc gets initiated by higher voltage peaks in a resonant circuit?

Check that the mechanical counters are aligned where you think they are, that is that the numbers shown are the ones that the transmitter is actually tuned to.  If it is way off freq it could do that, too.

Check the HV wiring under the 3B28's it's all very close there, maybe you're not looking for a crack, just a 'weak' spot in the insulation.  Just for something to do try putting some more insulation on the wires where they cross or where they go through the chassis.

Make sure the spark gaps are at the proper distance and ALL is clean, clean, clean.

Things get more fun in the RF drawer, though. I heard some arcing at 2500V when I powered up contact E3, the lower high voltage contact at the rear of the deck. After pulling V1 and V2 (the PA and clamper tubes) I didn't hear the arcing, which makes me think it was internal to one of the tubes... and hopefully, I didn't damage either of the tubes by doing this. However, when I turn up the voltage to 5kV (with the tubes removed), I get arcing underneath the V2 socket from pin 2 to the adjacent ground tab on the socket. This may not be the cause of my overloading problem, but it still seems suspicious. I notice that the connection under the chassis between the PA screen and the clamper tube (the net that I'm charging up in this test) is made with ordinary hookup wire through the wiring harness, which seems odd for a net that can see some high voltage. Maybe I don't understand how that net works in operation, though, where the tubes are warmed up before B+

is applied. I know that 5kV is a lot higher than normal operating voltage, but I'm looking for the weak link(s) in the high voltage wiring and insulators.

I don't think that this particular under-socket arc is my main problem, but I'll still clean up the crud on the socket bottom and bend that ground tab a bit farther away.

I haven't found any other obvious HV wiring problems yet, including where the HV wires pass through the chassis. I've been poking and prodding those wires with my shorting stick while under test to help find any weak spots in the insulation.

Does it sound like I'm on the right path to locate my suspected arcing path? Can y'all see anything wrong with the way I'm approaching this?

Good thought Joe –

Mark: do you get the same results if you switch HV to the tune position?

Separately, I'll email you directly on Saturday where I had problems with a zorch in the tank that was cleaned up by trimming back the sharp edge of a bracket.

Check that the mechanical counters are aligned where you think they are, that is that the numbers shown are the ones that the transmitter is actually tuned to. If it is way off freq it could do that, too.

Usually the HV breaker trips, IIRC. I seem to recall that it happens on dead carrier. So far I haven't found any carbon tracks on insulators, or any cracking of the HV wiring. Testing at around -5200V with my insulation resistance tester hasn't found any issues yet.

Maybe I'll fire the Tx back up this weekend to see how it's behaving...

> First thought is that there is a weak spot in the tank circuit where a bracket is a too close to one of the coils. Others may be able to tell you specifically where this is as it seemed to be a common issue.

I'll look there some more. I haven't been able to recreate the problem at -5200V DC, but maybe the arc gets initiated by higher voltage peaks in a resonant circuit?

I found a tricky spot where the high voltage was breaking down to ground on my T3, it was on the inside of the high voltage feed thru insulator on the back of the RF deck, the one that carries the modulated B+ from the spring contact finger. You actually have to pull the insulator apart and look inside to check it. Mine was filled with bits of carbon and some black tar like substance. upon further investigation I found that It is not uncommon for these to fail. In the case of my T3 it would trip the breaker when modulation approached 100% but that was due to the breakdown being on the insulator that carried the modulated B+. Other insulators will probably exhibit different failure modes. Some insulators have been known to have tiny holes punch right through them when they arc over to the chassis. Hope this helps.

I haven't noticed any problems in tune position that I can recall. I've had the radio down for over a month, though, so I may have forgotten something. I'll give it another test run when I have a chance. I just got a new toy (a 5-ton 6x6 military truck from a government auction), so my attention is divided right now! :)

I've checked/cleaned/de-tarnished the HV contact on the power deck, but not the other decks yet. I'll go through them next. Even though I'm not reproducing the problem with DC from my insulation resistance meter yet, it may be that something is different enough in normal operation to make a difference in this failure mode.

Mark,

Just make sure you separate the two halfs of the feed through insulators when you inspect them and check their insides for carbon paths. Be careful not to damage the insulators when separating the halves.

Joe,

Don't quite understand your question. The conducting path was through
the ceramic to the center conductor but the hole where the bolt went
through too skinny to get a look-see. Could see burn marks on the
bolt,of course, and on the chassis opening where the insulator was
mounted.

FOR SALE:

Over PL259 / SO239 plugs, sockets, adapters etc. for RF coaxial connections.

Each group has about 15 - 20 pieces of mostly new / new old stock PL259 and SO 239 connectors and adapters of all kinds. These normally sell for several
dollars a piece. Some of these include a few odd 'N' connector or adapter etc. I have added a couple of other pieces
to these kits to sweeten the deal.

The remaining groups are each available for $12.00 per group plus shipping.

Pictures and details with ordering buttons are available here:

http://www.af4k.com/connects.htm

73 & thanks for looking - Bry, AF4K

Max,

I've forgotten what setup you have. You list BC-610-E. I presume that the speech amp is a BC-614-E (or -H or -I which behave the same). Are you using a JB-70-A? If not, what modifications did you make in order to make the PTT function work from just the speech amp?

In the original setup, the primary PTT relay is a 12 VDC one in the JB-70. Its contacts ground the 6V6 oscillator cathode and complete the 115 VAC circuit to the coil of the plate relay in the 610. Plus some other things that don't matter.

Also, in the BC-614-E...I, the meter reads the 100TH modulator plate current. With no high B+ in the transmitter, the only thing I could see that the meter might indicate would be 100TH grid current.

well , i wondered if that was the problem as i had the same thing . it went away after i had left the power on to the shelter, as the charger topped up the battery. alan

I assume that you're looking for one of the "telegrapher's mill" typewriters. I searched on and off for years before finally finding mine on eBay. I never had any luck with automated searches, since the sellers of these items often don't know what they have. I ended up just manually searching suitable brands, models and years of typewriters (especially but not exclusively typewriters noted as being army, navy, WW2, military, etc.), and examining the pictures for any signs of them being the right kind of typewriter.

Mine wouldn't type at all when I got it. The curved casting holding the intermediate type linkages appeared to have tightened up around the linkages over the years due to corrosion or something. I had to completely disassemble the type linkages and laboriously scrape each of the slots sider with the edges of razor blades. I have the type bars working well now, but the unit still frequently advances the carriage two spaces when I hit keys. I haven't worked on the spacing problem yet; when I got the type bars working, I declared temporary success and crammed it in the closet so I could focus on other projects for a while. :)

I used a Navy mill for four years in the Navy as a ditty chasing radio op. They all skip spaces. When I was in radio school in Pensacola Fla,
we had a weekly typing test plus the weekly cw speed of the week test. Can you imagine being tested using a goofy typewriter? We were
just "SOL" if the skipping got us. I used a Royal 10KH here in the shack since I got out of the navy in 1970. It was a fine machine but finally gave up. I could see that it would take a major dismantling
to repair. Unless one is a clock work repairman, they will become
uneconomical to repair. They are rather fragile, and don't take to
shipping well. (I.E. Ebay)

# 5106. FS: Carbon Comp Resistors etc.

Yahoo group: T-368_BC-610
Date: 2012-04-09 16:23:10 UTC
From: Bry Carling
Topic: 5106  Message: 5106

FOR SALE: CARBON COMPOSITION RESISTORS

Here are some grab bag assortments of ALL NEW 2 WATT, 1 WATT and 1/2 WATT resistors, with a good mix of values from 1 ohm to 15 Megohms. Authentic parts made by Ohmite, IRC etc. Ideal for homebrewing and repairs tube radio transmtters and receivers etc.
1 Watt and 2 Watt resistors usually cost around $1.50 to $3.00 each when you can find them... Half watt resistors are $2.00 each at Radio Shack. A Surplus Place in Nebraska sells
them for $10 to $15.00 for a 50 pack.

SPECIAL: The first 5 orders will get a free bag of 100 new resistors.

2 WATT Resistors Packs - Quantity 50 - $10.00 each
1 WATT Resistor Packs - Quantity 100 - $10.00 each
1/2 WATT Resistors Packs - Quantity 100 - $8.00 each
LARGE MIXED BAG of 500 - 2 Watt, 1 Watt and 1/2 WATT mix of mostly New and Good Used Resistors - Quantity over 500. All for $12.00

Also: LARGE BLEEDER RESISTORS FOR LARGE TRANSMITTER PROJECTS:
Examples:
12Kohms at 40 Watts $9.00
50,000 ohms at 100 watts $18.00
25,000 ohms at 100 watts $19.00
15,000 ohms at 120 watts $16.00
16,000 ohms at 50 watts $13.00

ALSO - most "Common Values" of the 2 Watt and 1 Watt resistors are available. From 1 ohms to 22 Megohms.
A few exceptions are unavailable such as 100 K, but I do have some 110 K which will work fine in most applications.
These are brand new resistors with full lead length and are excellent 5% and 1% components.
Available for the following prices:
2 Watt = $2.00 each / ten or more of same value for $1.75 each
1 Watt = $1.00 each / ten or more of same value for $0.80 each
1/2 Watt = $0.70 each / ten or more of same value for $0.60 each
Shipping additional.

Pictures and details:

Alan,

There is a Yahoo group for typewriters,

http://groups.yahoo.com/group/TYPEWRITERS/

and I see there have been some discussions about "mills" on there, might be worth asking if anyone has a lead on where you could find a machine for your SCR-399. I believe there were several models used and "telegraphic typewriter" is how they were described, i.e. no lower-case letters.

# 5108. REDUCED: Panel Meters - under $3.00

Yahoo group: T-368_BC-610
Date: 2012-04-22 14:31:14 UTC
From: Bry Carling
Topic: 5108  Message: 5108

REDUCED: Panel Meters

Here is a nice box of six panel meters in very good condition.

These are all the typical 3.25" diameter meters you see on older ham equipment, test equipment etc.

1) Weston model 476 with 0 - 120V AC with an additional scale for 60V AC

2) Weston model 301 with 0 - 140V DC with an additional scale for 7 V DC.

3) General Electric model ADK84 - cool 0 - 200 mA PA Plate with markings for CW, MCW, PA Grid and Battery.

4) General Electric with 0 - 50mA DC

5) Weston model 147866 with 0 - 5V AC

6) General Electric Time Meter - model 8KT8E3 / USN type 120V AC 60 Hz (small case chip)

I do not want to sell these individually. I will sell these as a group. The whole box for $16.00
plus $12.00 for USA shipping

# 5115. OT (only partly) Preserving Group Knowledge

Yahoo group: T-368_BC-610
Date: 2012-05-04 20:16:36 UTC
From: Trevor
Topic: 5115  Message: 5115

I increasingly read credible sources that suggest Yahoo may be in serious decline, and if it is
like other big IT companies, the end is not always predictable or pretty, and it is hard to know
where (or if) "pieces will land."

This Group's past messages are a valuable compilation of a lot of useful, practical information.

Is or can any effort being made to create a separate archive of the information here? [grammar on
that sentence was rotten, but hopefully the point is clear]

I have no competence to solve the issue, but wanted to ask in hopes that others can.

Trevor in VT

# 5116. FS: More 2W, 1W and 1/2 W Carbon Resistor Packs

Yahoo group: T-368_BC-610
Date: 2012-05-06 11:47:28 UTC
From: Bry Carling
Topic: 5116  Message: 5116

Hi guys,

I know a lot of people asked me for some more of these resistors and I found some.

As of right now, I have found 6 more assortments of New 2 Watt Carbon Compopsition Resistors (50 in each.)
I have 3 more packs of the 1 Watt carbon composition resistors (50 in each.)
and I have another 8 packs of the 1/2 Watt composition resistors (100 in each.)

I have posted these on my web pages for easy purchase for whomever would like some.
2W - $15 each
1W - $10 each
1/2W - $8 each
For anyone who buys 2 or more of these I will throw in a surprise pack of 50 - 100 new resistors of my choice. FYI - one or two of the 2 watt resistor packs might contain a couple of
good used looking resistors or shorter lead ones but you won't be disappointed.

http://af4k.com/resistors.htm

There are also some very excellent, useful power resistors and bleeder resistors etc. at that
link.

Thanks for looking & 73 - Bry AF4K

Topic: 5118  Message: 5118

I'm currently helping a friend rebuild a bc-610 F series.
We found the PA output tuning cap has about 1/2 the plates of any other 610 we have looked at. Others have 11 plates on each half of the stator.
Does anyone have any ideas.
Oh yeah, the clips for the vacuum cap are missing.
Except for a couple of output leads, the final tank components look as though that haven't been touched since it was built. 1949 according to stamps.
Thanks much

Possibly a late 1940?s ham mod to put it on 10m? I remember reading an old article from the late 40? in either QST or CQ involving just such a mod, but I understand they were quite unstable on 10 even with the mod. Maybe not but your description made me remember this. If it was done well, and 50 years ago, it could well look original by now.

Dave
Thanks for getting back to me.
That does make sense. Just wonder what coils they used as I don't think
Paul got the set with it.
Funny, I just made a crack about the internal lead lengths in the tubes
and wondering how they would act at higher frequencies.
Now if only I could find the olde articles.'
Thanks again

That would not be correct. The HT-4 as originally advertised, gave
Amateur Operators a selection of three bands with the purchase. That
included an selecting 10 meters as one of the three. The HT-4 when used
on ten meters did NOT have a different number of plates in the PA Variable.

The Military did NOT like the ten meter use! They found that while
mounted in the Comm Shelter in/on the truck, (The BC-610 initially
shipped in an old panel truck - not a Deuce and a half.) That came
later. The military would operate while moving, and quickly that 10
meter operation had RF crawling all over the outside of the BC-610 cabinet.

Therefore they ceased operation on 10 meters.

Someone "hacked" up this particular PA variable for an unknown reason.
It was NOT a modification used by the Military, nor did they get
manufactured that way by the different Manufacturer's

My information comes from WB2FCN that operated them in Europe in the
'60s while he was in uniform. He restored the one that is on my website.

Gentlemen
Thank you all for the answers.
I looks as though that someone made unauthorized mods to the 610 when it was out in the field.
Possibly some kind of clandestine or experimental operation.
Now the plot really thickens.
When I was stationed outside of Washington we did just that in the R&D lab in our unit.

Alan, I am looking for a modulator deck to complete my BC-610 E.
All I have is the -completely- stripped chassis of the mod deck. If
you, or anyone you know, have one please let me know.
Thanks Gary N9ZSV

Subject: Re: [T-368_BC-610] typewriter
I assume that you're looking for one of the "telegrapher's mill"
typewriters. I searched on and off for years before finally finding mine on
eBay. Mark J. Blair, NF6X <nf6x@...>
http://www.nf6x.net/

I found a guy in San Diego who still reworks typewriters. The shop I used
to go to closed years ago.Anyway, the WWII Navy Underwood mill came out
great, ready to go with a RAK/RAL:

# 5128. BC-610H To Begin Restoration

Yahoo group: T-368_BC-610
Date: 2012-05-22 15:21:48 UTC
From: n2len
Topic: 5128  Message: 5128

Hello Everyone,
I just picked up this weekend the beautiful donated gift of a BC-610H from Bill Kish.
Even though I missed Dayton this week, for me this topped any Dayton trip!
I wanted to query anyone here on the forum who went through the process of restoration with any information to share.
I needed to make 2 trips for complete pickup. Presently the Power Supply Deck and the Mod Deck was removed to make transit easier. The transmitter needed to be somewhat disassembled to make transit easier down a long flight of wooden steps.
I rented a heavy duty hand truck with straps to move the power supply deck. For some reason I thought it was heavier, but 2 people easily removed it out the back of my Excursion into the garage and placed on 2X4's.
Anyway, I only began cleaning out the dust, and wiping down each assembly.
This beast is quite clean, only a little amount of surface rust on the bottom of the cabinet where it meets the Dollie. It was stored in a dry environment for many years unused.

All of the tubes were removed and wrapped in newspaper and stored in a box since the early 80's. I have 3 tuning units. (2 of which suffered from some surface rust on the sides.) I also have 3 Coil units. I haven't unwrapped any of the tubes yet and have not inventoried any of the remaining parts in that box.

I want to first continue the clean up of dust and dirt.
I love the fact that everything is so spread out with a ton of room.
So my first question is:
Will the front cabinet pull apart enough without complete dissemble?
I want to continue cleaning the back of front panel.
Or should I remove the RF deck?

I have been contemplating a complete disassemble, in order to fully wash the metal cabinet.

Some far off ideas...
Can I excite with the VFO from my 101E?
Whats the best setup for use in the Am window?

Here is another question I have been wanting to ask for sometime. I usually use denatured alcohol to clean everything. Anyone have suggestions on how to properly clean the glass of a tube without removing the labeling?
I just have been wiping everything and carefully avoiding the labeling.

Tonight, a rainy evening will be skimming through the Tech manual, becoming quarantined with the internals.

Thanks again Mr.Kish, and Bob for passing this information along!

Len,

You can look over my web page for a bunch of info.

<http://home.comcast.net/~rbethman/bc-610.html>

WB2FCN did the actual work, as so noted.

The back panel, and both side panels can be removed easily.

You'll definitely need to remove the PA deck BEFORE you attempt to
remove the front panel!

The front panel is attached to each of the decks by terminal strips.

Pay careful attention as to which connection goes where! It isn't for
the faint of heart, and it is very easy to reconnect the wrong wire to
the wrong terminal during reassembly.

Congratulations!

Much work in front of you!

# 5130. Re: BC-610H To Begin Restoration

Yahoo group: T-368_BC-610
Date: 2012-05-22 16:07:59 UTC
From: n2len
Topic: 5128  Message: 5130

Hello Bob,
First off thanks for the initial listing of it!

Here is where I am currently. Just in the "cleaning off the dust stage". When I went over to Bill's QTh, he already dismantled the power supply deck and the mod deck. So after I finish cleaning it all up, I would kindly ask if anyone can supply me with some closeup digital pics of each terminal strip. Bill also presented me with the original owner manual, which I am only beginning to skim through. I will really sit down with it over the next couple of nights to further educate me with this beast. I have been using denatured alcohol to clean the chassis, it is not really strong enoght to cut through the caked on dust I have used 409 on my junkston 500 and many other chassis, but not with this varnish type of yellow chassis.
What do you guys recommend? I was also debating to completely remove the front cabinet, all the switches and controls, meters etc.. to give the cabinet a complete soap scrub and hosing. Any ideas? I really don't like to paint or power coat and silk screen unless its completely necessary and would rather keep it all original.

My queries are also posted on Amfone.net with pictures....
http://amfone.net/Amforum/index.php?topic=31443.0

Regards,
Len

Len,

The yellowed varnish looking coating is probably MFP varnish. Whatever cleaner you choose to use on the cabinet will work fine on the MFP.

One warning - never trust bleeder resistors, especially on the HV deck. My first flying trip in 1962 was courtesy of one in a BC-610-E.

Len,

Use non pumice automotive hand cleaner , a toothbrush and water to clean chassis.

Apply some of the hand cleaner, rub in gently with soft tooth brush and let it sit a little while.

Then wipe off with damp rag until clean and air dry.

Just get it running for now.  You can always make it prettier later.

I swear I own the ugliest 610E there is - but what a reliable performer.

de KA4JVY

So after I finish cleaning it all up, I would kindly ask if anyone can supply me with some closeup digital pics of each terminal strip. Bill also presented me with the original owner manual, which I am only beginning to skim through. I will really sit down with it over the next couple of nights to further educate me with this beast. I have been using denatured alcohol to clean the chassis, it is not really strong enoght to cut through the caked on dust I have used 409 on my junkston 500 and many other chassis, but not with this varnish type of yellow chassis.

Len,

Robert Downs has already commented on the MFP coating. That being what you refer to "Yellow Varnish". You can even use 409 or such, just don't get the transformers or relay coils wet.

Close up digital pics are a royal pain for anyone to obtain, as they would have to take their's apart to do so.

The TM will lead you through the connection of the terminal boards, just pay careful attention.

You "may" find a few wires that you will deem needing replacement due to age. Not uncommon.

Tearing the front panel completely down is really not the best idea. Be carefule with the PA current meter! It IS a sealed meter! It also is insulated from the front panel by an insulating ring.

All the relay contacts will very likely require cleaning. This is normal for one of these that has sat for a period of time.

The potentiometers on the front panel may also need a bit of cleaning. Use one of the Caig products designed for such, as their "Fader Lube". Just do NOT over do it!

Bob - N0DGN

Thanks for the reply and suggestion noted! I'm thinking so far that this beast wont need much to get back online.

From: rbethman
Topic: 5135  Message: 5135

Len,

You'll find this group to be very helpful.

The knowledge, experience, and expertise is very broad.

About the only thing members won't do, is come visit you and do it for you! (LOL!)

As an aside, if you really want to use something other than tuning with the MO, you should look for an HP-3336 Frequency Synthesizer. It doesn't matter much as to whether it is an "A", "B", or "C" version. This provides a direct digital readout, and the output is adjustable to get the necessary 2V RF to input to the Tuning Unit. Just use an old FT-171 crystal that doesn't fit anywhere, frequency wise, take out the crystal, the spring, and attach the coaxial cable, RG-79 will work fine, as the short length of cable, coupled with the 75 ohm output won't make any difference.

(This is information direct from WB2FCN! He drives one of his two BC-610s with this method.)

I am now doing the same. I located one of these for about $80. To top it off, it was still in calibration.

Len -

I went thru a transmitter that was in much worse shape than yours' apparently is. I had to completely disassemble mine and strip the CAD plating, then re-plate and re-letter each chassis. You may find some of the pictures useful from my "BC-610 Transmitter" gallery at:

http://www.longandflatsociety.com/WB6AZPBoatanchors/BoatanchorGalleries/tabid/451/Default.aspx

The gallery shows both Before and After pictures, but they're not sorted.

Good luck !

John WB6AZP

Subject: [T-368_BC-610] BC-610H To Begin Restoration

Hello Everyone,
I just picked up this weekend the beautiful donated gift of a BC-610H from Bill Kish.
Even though I missed Dayton this week, for me this topped any Dayton trip!
I wanted to query anyone here on the forum who went through the process of restoration with any information to share.
I needed to make 2 trips for complete pickup. Presently the Power Supply Deck and the Mod Deck was removed to make transit easier. The transmitter needed to be somewhat disassembled to make transit easier down a long flight of wooden steps.
I rented a heavy duty hand truck with straps to move the power supply deck. For some reason I thought it was heavier, but 2 people easily removed it out the back of my Excursion into the garage and placed on 2X4's.
Anyway, I only began cleaning out the dust, and wiping down each assembly. This beast is quite clean, only a little amount of surface rust on the bottom of the cabinet where it meets the Dollie. It was stored in a dry environment for many years unused.

All of the tubes were removed and wrapped in newspaper and stored in a box since the early 80's. I have 3 tuning units. (2 of which suffered from some surface rust on the sides.) I also have 3 Coil units. I haven't unwrapped any of the tubes yet and have not inventoried any of the remaining parts in that box.

I want to first continue the clean up of dust and dirt.
I love the fact that everything is so spread out with a ton of room.
So my first question is:
Will the front cabinet pull apart enough without complete dissemble?
I want to continue cleaning the back of front panel.
Or should I remove the RF deck?

I have been contemplating a complete disassemble, in order to fully wash the metal cabinet.

Some far off ideas...
Can I excite with the VFO from my 101E?
Whats the best setup for use in the Am window?

Here is another question I have been wanting to ask for sometime. I usually use denatured alcohol to clean everything. Anyone have suggestions on how to properly clean the glass of a tube without removing the labeling?
I just have been wiping everything and carefully avoiding the labeling.

Tonight, a rainy evening will be skimming through the Tech manual, becoming quarantined with the internals.

Thanks again Mr.Kish, and Bob for passing this information along!

Thanks Bob..
I'll check out the HF-3336. May even go fixed crystal. Can these 171b's be recrystallized for the Am window?

Yes, they can.

However, finding FT-171s is not the easiest thing in the world.

They are around, just not overly plentiful.

You can look at AF4Ks site. He does have some number of them. However
they also aren't cheap. They tend to run around $20 ea. or more.

Len,

Keep in mind that the FT-171B crystals operate in the oscillator section in more than one way.

First - They operate at the frequency stamped/printed on the front.

Second - They will double!

Third - They will also triple!

So you "can" get more use from a single crystal. Once again, make sure you use the appropriate Tuning Unit and PA coil for the desired frequency!

From: Mark Foltarz
Topic: 5135  Message: 5142

I have ground my own crystals for the 610.
Relatively easy to do.
Remember you can only "grind up" in frequency - the more mass the lower the frequency.
I keep finding them here at Florida hamfests.
I have my 610 "rocked up" for 3655, 3675 and 3885.
The TUs rarely need tweaking so to qsy all I have to do is select the frequency then dip the plate.

Len,

One other thing I'll suggest.

If in the tubes that you have, should there be 866 mercury vapor rectifiers, I'd suggest that you pick up a pair of 3B28s instead. They are a direct replacement. They also are Xenon rectifiers, and eliminate the problems inherent with the Mercury arcing over.

It indeed became one of Uncle Sam's changes.

Len -

My transmitter was an Ebay purchase, and it came out of the Atlanta area. I don't think it was stored outside, but it must have been in a barn or shed. One or more critters called it home for awhile. It didn't look too bad when it arrived, but when I opened it up, I found it chock full o'nuts. You can see the damage on all the chassis.

I figured at that point I had nothing to lose, so I put on heavy rubber gloves, removed the icky stuff with oven cleaner and a hose, then carefully disassembled it. Most of the parts went into the bead blaster. I had the chassis and a lot of the hardware replated in CAD-1, and created a stencil set in the correct font and relettered all the chassis.

I was able to use some of the original wiring, but had to rebuild some with new (correct) wire. I also made silk-screens for quite a few of the transformers then stripped, painted and rescreened them, too.

The front panel was actually in pretty good condition, and after scrubbing with soap and water, I carefully masked the lettering and sprayed it with SEM brand "Original Trim Black" automotive paint - that stuff is the correct sheen, and it's thin so it doesn't fill up the wrinkle paint. It came out perfect.

If anyone needs the Corel silkscreen files for the transformers and/or the lettering, I'm happy to share.

Len,

Once you get things sorted through, let the group know what Tuning Units you have, and what PA coils you have.

Those items are NOT rare, and some have extras in their horde of parts.

hi , well , we just got on with the job ! the only bit in poor shape was the roof. this is actually canvas stretched over wood and painted . beneath this is an early sort of fibreglass. we removed the old canvas , and the wooden laths were mostly ok . those which were not were replaced with treated ones . the canvas we used to re cover the roof was ordinary vehicle stuff , the same as the GMC .once this was fitted , it was painted with several coats.
the interior was fine and is in the original paint . it looks great , and very little else had to be done except cleaning and polishing .
ours was in use by the luxembourg army until the 60s as we have message forms dating from then. good luck ! alan

John,
That's great and something to be proud of!
I enjoyed reading what you used to clean out the crud!
Someone else who I was replying to in the Amfone site also masked the original lettering from the front panel and lightly sprayed it.
I would love to have the artwork if you don't mind sending the files.

Cleaning the mod deck today, ended up with nice results.
Pics posted here.
http://amfone.net/Amforum/index.php?topic=31443.0

I am thinking to go ahead with the removal of the RF deck, then front panel. To fully scrub it.

Alan,

Thanks for the info, regarding Checker Company. Good work finding the handle.

Aladdin Company in Michigan, a "Kit Home" manufacturer, may also have manufactured those shelters, as there are some records in a collection of company papers in the Clarke Historical Library at Central Michigan University, but being in Virginia, it will be a while before I get a look at any of those documents.

Your picture was stripped by yahoo, by the way.

Again, many thanks, every bit of information helps.

regards,

Tom

From: Bill Harris
Topic: 4625  Message: 5154

In the mid to late 30's; Hallicrafters produced a tuner. Nothing like the BC639.It was housed behind a 19 inch wide panel with two tuning knobs. The number "AT-1" comes to mind but, I may have that confused with a Heathkit number. Anyone out there with a better recollection than mine?

Paul,

I'd be surprised if there weren't several manufacturers. I'll like to see the drawings the shelters were built to so I can judge the practicality of making a reasonable replica. Not the top of my list, but certainly a point of curiosity. Among others...

regsards,

Tom

Bill,

It will take more than a manual. Reading the page that the picture is
on states that it is intended for ladder line antenna feed, AND requires
plug in inductors.

I wouldn't imagine that they would be easy to locate.

# 5162. Antenna Tuners

Yahoo group: T-368_BC-610
Date: 2012-05-23 14:23:59 UTC
From: rbethman
Topic: 5162  Message: 5162

Bill,

You'll note that the AT-2 is a PI Network.

The AT-3, better known as the BC-939, is a horse of a different color. Its purpose is to less act as an antenna tuner, and more like an Antenna Coupler. It will not tune a coaxial fed antenna, and the design results in feeding either the 25 foot whip that was used on the communication shelter, or to feed what Uncle Sam called "Long Wire" antennas. When one read the manual, you find that those are different lengths dependent upon the desired frequency range, and while its input impedance is 50 ohm, it couples to antennas with an impedance of 300 ohms.

I can tell you that these old Beasts will NOT work with a "T" network! I've tried that.

I wonder if there was an AT-1?

Bob - N0DGN

Hi Bill,

I have an HT-4 manual, probably pre-WWII, that contains the AT-2 info and photos. It's basically a double pi-network selectable for balanced or single feeders. I'm away for a couple of weeks but would be happy to scan it for you when I get home.

Hi Roger:
I would be most appreciative if you would do that for me.I've been searching the iNet for information on this unit andso far it's been NO Joy; other than a 1940's Ad, sent to me by SteveG.
http://groups.yahoo.com/group/T-368_BC-610/photos/album/430669730/pic/472037735/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc
I'll drag the tuner out from storage and open it up. If it's a dual Pi-network, I could put it to good use.

# 5165. Re: BC-610H To Begin Restoration

Yahoo group: T-368_BC-610
Date: 2012-05-23 17:08:35 UTC
From: n2len
Topic: 5128  Message: 5165

After contemplating the removal of the front panel, that was today's project. Cleaning behind the front panel would have been quite difficult and I want to really inspect all panel connections. Now that the panel is completely off, I think my next step will be removal of all the switches, meter assembly, etc. That will make scrubbing of the front panel much easier. I will then make a determination whether or not to simply treat the rusted areas, mask the lettering and respray or a complete sandblast/screen. This will require copying the artwork which I don't have experience with.
In my own opinion, I would rather keep it as original as possible.

However, Your opinions on the next step are valued...

Len,

Having looked at the two pictures pretty well, I'd say cleaning up the rusted areas, treating them, and a thorough cleaning followed by masking off the markings, you'd do well with a simple over paint job.

The dirtiness inside the front, and the rub marks on the front are typical. Most of us just clean them up pretty well. They haven't been perfect since they first came out.

The exceptions are few. I have the last version to come out of Depot, the T-213.

I'll tell you right now, they did NOT do a silk screening! They actually used stencils!

I know that I don't want to tackle a silkscreen job either.

(I'm going to have to take pictures of the T-213 one of these days. When I do, I'll put them up on my site.)

Len,

I once owned three T-213's that were surplused straight out of Depot. One had been an F. The other two were either H's or I's. I no longer recall which ones were done which way, but one looked absolutely brand new (black wrinkle with silk screened lettering). One had been stripped and repainted in black semi-gloss and the lettering looked like it had been done by hand. The third had masking rectangles visible over the lettering and had apparently been simply over-sprayed with a very thin coat of black.

So as far as making yours look like it just came out of depot, you have a lot of latitude. :-)

Subject: [T-368_BC-610] RE: Re: Hallicrafters AT-2 Antenna Tuner

I've uploaded pages 12-26 from the manual to the "KE5O's HT-4B" folder.

Pages pertaining to the AT-2 are 13,15,16,24 & 25.

73,

Steve ke5o

Hi Roger:
I would be most appreciative if you would do that for me.I've been searching the iNet for information on this unit andso far it's been NO Joy; other than a 1940's Ad, sent to me by SteveG.
http://groups.yahoo.com/group/T-368_BC-610/photos/album/430669730/pic/472037735/view?picmode=&mode=tn&order=ordinal&start=1&count=20&dir=asc
I'll drag the tuner out from storage and open it up. If it's a dual Pi-network, I could put it to good use.

Hi Bill,

I have an HT-4 manual, probably pre-WWII, that contains the AT-2 info and photos. It's basically a double pi-network selectable for balanced or single feeders. I'm away for a couple of weeks but would be happy to scan it for you when I get home.

That's very interesting. So one was new, and some refurbished!

Continuing this afternoon, spent a couple of hours dismantling all the controls from the front face.

The Excitation meter removed easily with no de-soldering. However, the Plate and PA meter wiring will have to be de-soldered to fully remove.

Also the 2 operation lights will need to be de-soldered, and the 2 smaller glass fuse holders.
Each of the 3 large fuse holders wiring can be unscrewed and removed. IN order for the entire wiring harness to be removed, all of the de-soldering listed above will need to be done.

Even though I have many years experience with soldering, I don't feel to keen about re-heating the contacts and undoing the factory wiring, which is probably wrapped well around the contacts. Much heat can cause the contact to free it self internally. So I thought about sniping the cables.

Now that everything is pretty much loose, I am also thinking about leaving everything in tack, taping the light holders, 2 fuse holders, and taping each hole and cleaning/paint etc...that way. But the 2 other meters would have to be removed. So something has to be done to remove them. One looks like it will de-solder easily, the other and all the other parts will require unwrapping the factory wiring at each contact.

Thoughts?

Actually, no. I'm one owner of a T-213. It has the date in 1959 that it was gone through.

The BC-610s that became T-213s ALL went through Depot. They had been completely gone through, and modified to become T-213s.

A bunch of folks don't realize that even into the '70s that these were still in use by Uncle Sam.

One was deployed to Arecibo. Yep! Right at the BIG Radio Telescope.

No, I meant that externally it looked brand new. But it had definitely
been used as one of the round transformers (hallmark of an F) had been replaced
with a square one (actually one out of an E). So it had been repainted.

Back to the project, having come this far, I would desolder. From the rear
view photo, it looks like the switch might go through the filament voltage
meter hole. Worth a try, anyway. One of the wires to the PA current meter
is already loose at the other end. I would disconnect the other wire at the
"other" end as well. That only leaves 8 wires. Just be sure to remove the
lamps and fuses first.

The Power Supply deck hasn't been moved. So I decided to clean it right where is sits! The 409 did a great job on the Power Supply Deck. There was slightly more oxidation on it then the Mod Deck. Removing the relay cover exposed "2 Like New Relays"! Not bad for a 50+ old beast!

From: Roger Basford
Topic: 4625  Message: 5174

OK Bill,

The manual I have has the AT-2 looking more like the HT-4, more decorative chrome strips, I think. There should be an antenna c/o relay inside for receiver connection too.

That advert you posted is post-WWII but the top ATU looks similar to the pre-war model. I have another HT-4 manual from the same era with the later model BC-610-I being renumbered as HT-4 and the BC-614 as an HT-5.

Anyway, I should be able to scan the relevant pages for you but it won't be before the first week in June.

I would imagine the only thing more rare than an AT-2 with all the plug-in inductors, would be the HT-7 Frequency Standard.

This would have served essentially as a VFO for them.

Date: 2012-05-26 21:45:55 UTC
From: Bry Carling
Topic: 5177  Message: 5177

For auction:

WESTON AC LINE VOLTAGE METER 0 - 150V AC in a beautiful case. This is a first class test instrument with a large reflecting galvanometer scale from zero to 150 volts AC. It also has a scale for 0 - 15 V AC and separate terminals on the side for both ranges. Model is 433 / serial number 30418. It includes highly calibrated markings for the internal resistance.

The last calibration was conducted by the U.S. Navy Calibration program and it has the stickers from their standards calibration laboratory in Indianapolis,. Indiana dated October 1962. I checked it against a modern digital meter and it appears to be very accurate.

Dimensions are approx. 6" X 3" X 5-1/2" tall.
The rubber feet are there and in very good condition.. There is no handle.

It will be carefully packed and insured.

Starting price is $25.00 for this beautiful precision instrument.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=110887188019

Thanks for looking - Bry, AF4K

Hi Bill,

As promised, I have uploaded a couple of photos and a schematic of the AT-2 tuner. These are in the Files section of the web site under AT-2.

I've scanned these from "Operating Instructions for the Type EP134 Radio Transmitting Set" Hallicrafters Part No 94-001. There's no date on the book but I'm guessing it is just pre-WWII and appears to be for the HT-4B in commercial applications. The tuning units shown are pre-BC-610 and the transmitter coverage is only 2 to 8 Mc/s.

Hope this helps you,

73

Bill,

Would it be possible to photo and post the rear of your AT-2 as it does not appear to be covered in any documentation from Hallicrafters?
I've never seen one before.

# 5187. BC-610 parts at Manassas hamfest Sunday

Yahoo group: T-368_BC-610
Date: 2012-06-07 01:48:51 UTC
From: Thomas Chirhart
Topic: 5187  Message: 5187

I will likely bring a fairly large box of 610 parts and wanted to offer the lot to any member. Plug in coils, one new in original unopened box, some may need restoration, plastic separation, but some are ceramic and in nice shape. About 9 or 10 modules etc. email if interested, looking for $100 for all. Will take to the Manassas fest this Sunday. 73 Tom K4NCG

The restoration is coming along just fine...
Here are some pics and notes...

http://amfone.net/Amforum/index.php?topic=31443.msg246413#msg246413

--- In T-368_BC-610@yahoogroups.com, "n2len" <N2Len@...> wrote:
>
> After contemplating the removal of the front panel, that was today's project. Cleaning behind the front panel would have been quite difficult and I want to really inspect all panel connections. Now that the panel is completely off, I think my next step will be removal of all the switches, meter assembly, etc. That will make scrubbing of the front panel much easier. I will then make a determination whether or not to simply treat the rusted areas, mask the lettering and respray or a complete sandblast/screen. This will require copying the artwork which I don't have experience with.

Can anyone help?
By telling me the direct terminal location...

Today I am finishing up the rebuild of the cabinet.

I have Technical Manual TM 11-826 if you can point me to the diagram

I am working with my friend and hoping someone can shed some light on the final wiring...

First there is a white 16" wire with connector on each end. I believe it came from the power supply deck.

There are 3 small white stranded 3" jumpers...
It appears that one goes on TS 15 pins 2&3 for conventional operation.

ON TS-14 (power supply deck) We are using terminals 1-8 goes with the order of the harness. There were 9 wires from that harness the last wire appears to fall near the bleeder resistor. What goes on terminal pin #9?

Back in 47-48 there was an article in CQ mag i think it was that utilized a buffer amp (external) that allowed one to use a BC-221 or LM freqmeter with the 610.  If interested drop me a line at : Telegrapher@... and i'll see if i can find the article for you.

The restoration is coming along just fine...
Here are some pics and notes...

> After contemplating the removal of the front panel, that was today's project. Cleaning behind the front panel would have been quite difficult and I want to really inspect all panel connections. Now that the panel is completely off, I think my next step will be removal of all the switches, meter assembly, etc. That will make scrubbing of the front panel much easier. I will then make a determination whether or not to simply treat the rusted areas, mask the lettering and respray or a complete sandblast/screen. This will require copying the artwork which I don't have experience with.

There is an article in the 11th Edition of the Radio Handbook (1948)
on a BC-221 based general purpose VFO. Essentially a BC-221 mounted
on a larger chassis with a power supply and a buffer amplifier. The
latter was a three stage affair, two untuned 6AG7s followed by a tuned
6L6 with link output. One hundred-fifty volts regulated on the 6AG7s
and 300 on the 6L6. The article claimed that tuning the 6L6 stage to
the middle of the "3.5 megacycle band" (i.e., 3.75mc) provided
constant output across the band with no further adjustment.

Looks like a bit of overkill to me. Can provide circuit of the buffer
amp on request.

I built something like that decades ago if anyone is interested in it. I transplanted the BC-221 chassis to a standard 19" rack panel. Today I'm not too proud of the sheet metal work. But I definitely didn't have the machine tools in 1970 that I have today. I don't remember getting the circuit out of the Radio Handbook but I might have.

As I recall, it worked OK with a BC-610-F but mistuning the antenna would put RF into the FSK circuit. I had it in an open rack. Probably putting it into a metal cabinet would fix it but around that time I got transferred to Houston and its been in the garage attic ever since. If anyone is interested, it's available.

Hello,

I am new to the group but I have been working on radio restorations for years and have been a licensed amateur for 37 years. I have been loosely looking for a BC-610 for a little while now, but I have cleared up enough projects that I am in serious acquisition mode. I would ideally like to find a good unmolested (but unrestored) early model but I would consider a later one like an I model as well. It would be great to find something with the speech amp and tuner if possible.

Any leads are appreciated.

Many thanks

Gary,

I have a working BC-610I complete with the BC-614 speech amp and BC-939 tuner. Includes all cabling for the speech amp, all tuning units from 1.8 to 18 mhz and all plug-in coils from 1.8 to 18 mhz. The coils have all been repaired/rebuilt. Also included is a muting relay box for the receiver. This is a plug and play unit that is missing nothing

hello again . the trouble with the BC939 was not the slipping drive to the loading coil. i fixed that and it was still the same. it is behaving as though there is a dead short in the 939 . i ran a piece of cardboard between the wheel and inductor of L5 the coupling coil and the short is still there . the band switch was in a neutral position , eliminating everything else.
the only thing left is the coax from the terminals to L5. tomorrow i am going to take the unit out and de solder it from L5.perhaps some time in the last 70 years it has got really hot and melted the insulation allowing the central conductor to touch the outer. has anyone heard of this happening ? alan G4GEN

Alan,

If you find you need any special "bits" to fix the '939, I do have the guts of one at home. Be home again around the 31st. If you need a complete one to use in the SCR-399 for shows I could loan you the one I got from you and which is now rebuilt.

Still looking for any leads for purchasing a BC-610. An older model (i.e. E model) would be preferred. I am looking for something unrestored and unmodified.

If anybody knows of anything please let me know.

Thanks

Gary

hello guys , could anyone tell me if it would be a good idea to internally ground the output terminal on the BC610 which is connected to the outer of the coax link to the 939 ? it is in effect grounded in the BC939 .alan G4GEN

Topic: 4722  Message: 5222

hello guys, i have spent the last couple of days battling with the BC610 . someone wiser than i am must have an idea. in high voltage protect with the correct TU and coil for 3615 , i have loads of PA grid current with it all peaked up. the plate however dips at about 65 on the plate tuning instead of 30 and is very deep and sharp . it drops from 200 ma to about 30 . this rises to 50 in normal . this is on phone.it is higher on cw.
i have checked and double checked all connections around the tuning capacitor and coil, and all is ok .i am using the BC939 and whip antenna.
there is no short across the output and coax when the 939 and coil are disconnected, but continuity is fine all round. bt inspection , i cannot see anything amiss in the 939 .
tomorrow i will trya 50 ohm dummy load .
incidentally i am still after an RA20 power unit for my BC342 in any condition . cheers , alan G4GEN

Topic: 5223  Message: 5223

hello guys , i finally got the BC610 going well . the 939 matches the whip on 40 and 20 no trouble. it will not on 80 . however i encountered another problem. i wqs just starting a qso on 14 megs and there was a flash inside the tx and a fuse blew. i can see nothing burned or wrong anywhere , so have concluded that one of 3B28 s flashed over . are they ok ? i am thinking of going back to the solid state rectifiers . my troubles seemmed to start when i changed to the xenon rectifiers.
the other thing is the fuse . it was my last one. are they still available ? i thought that they might be standard american domestic fuses . alan G4GEN

Alan,

Those are no longer standard domestic fuses over here.

They "can" be found with a bit of trouble. The US moved away from the threaded in fuse methodology a few decades back.

Also, I'd do a bit more hunting. I've never heard or have seen 3B28s flash over. Look very carefully at the HV wiring for a trace left by an arc.

You might think so Alan, but unless you use the set maybe once or twice a year, chances are you'll use them up faster than you think. I purchased 75 or so 15A screw in type fuses for a transmitter I have here, maybe 5-6 years back. They are over half gone due to equipment malfunctions from aging components and other failures.

My suggestion would be to stock up when and where you can. Having Bob send you a handful will certainly give you some breathing space, but this is a case where more is better. I do base this on regular use of the equipment.

Watch ebay for large quantities. That's where I got mine for somewhere between 10-25 cents each buying in bulk.

Actually, I remembered after posting previously that you can buy resettable screw-in type breakers which would be a way to save fuses. Simply remove the breakers and re-install the fuses when the originality police show up for inspection. They don't work for my transmitter as the fuses are just behind the front panel and the breakers are too tall to fit with the panel in place.

I blew one once.

I have an "old" Ave Hardware by me. They have both types of screw in fuses.

I bought a box of each size over 10 years ago.

I've never needed any except that one time.

That's for the BC-610 AND the T-213.

hello joe , it works perfectly on 3615 , and i was heard in northern ireland yesterday evening, but too weak to read properly . this was on the whip antenna. the trouble only seems to be on 14 megs cw. i reckon it is rf .i have made a better ground with chicken wire attatched to the grounding spike and am getting 4 amps antenna currennt. in view of this i do not think it is faulty insulation. i had a really good look ,but it is so cramped behind the tx in the shelter. alan

Alan,

Have you checked for continuity through the aerial ammeter in the BC-939? If that is open you will only have the load presented by L5.

Hi Alan,

Check the aerial ammeter on the BC-939. If that is O/C you won't have any load on the PA, apart from L5, and there will be no connection to any of the other tuning components. Just put a jumper lead across the meter and then see if the tuner loads the PA. If the RF ammeter is duff, then use a field-strength meter and the PA current meter to tune for max output.

Remember that the RF Ammeter has an internal thermocouple.

Most do not.

This can cause issues if the thermocouple has gone tennies up.

hello guys , the tx is working fine on 80 now . this evening i was 5 and 8 in cardiff working into the whip antenna. yesterday i was heard in northern ireland , but it was too weak for a qso. i have made a decent ground with chicken wire laid out and in contact with the ground spike which is connected directly to the tx. i am loading it to 200 ma which i think is plenty.my problem is on 14 meg cw which causes it to make an arcing noise and blow the fuses . in view of this it is probably rf sommewhere. . it was greatly improved by cleaning the contacts in the 939 , but the grounding made all the difference. cheers , alan G4GEN

Alan,

You could possibly have a bad 14MC coil assembly. I had a coil with a rotating link cause me grief about a decade ago. It turned out to be the rotating link portion.

Of course, the signals would be a -lot- better when you use a resonant antenna.
Keeping the thing original is one thing - operating it to it's fullest capability really lets the old beastly-610 'shine' on the air-waves!

Allan, try putting up an antenna that's 120' on either side and feed it with either 450 ohm ladder line, or real 600-ohm open wire line and a tuner. I don't believe the BC-939 will accommodate that type of setup - but the signal will certainly be heard much, Much, MUCH farther away!

Under adverse conditions, certainly the old shelter and it's self-contained "mobile" operation is great for maintaining the 'museum' effect of the old WWII/Korean war artifact... but as far as operations on todays ham-bands, that rig SCREAMS for a better antenna system!

what are you doing with the my bc610?i wil it pick it up the next time (hi)
for the problem with the 14megs
put first the mo on 14200+/_and tune it as good as possible, then put a good xtal 3550 in the tu unit ,when this not workt you must try to clean the tu socket for the xtal and select some times the mo/xtal switch 73

hello guys , well , the BC610 really is firing on all cylinders now.! with the correct tuning coil and TU for 14 megs it did not run away on full power, but the pa current stayed the same once the key was released. i reckoned that it must be neutralisation .i went through the procedure meticulously and got a grid dip of around 3 ma as it said in the manual.
trying it with the antenna coax connected resulted in normal operation . running at just over 200 ma pa current . i had a report of 589 from belgrade using the whip antenna. it has been a long time ! now to get the BC342 going. i have obtained an RA20 with a faulty transformer and will get it rewound. alan G4GEN

I know that the US is restrained to 200 W PEP. I couldn't get that low an output if I tried!

Do you have similar limits?

I don't bother with crystals any more. I don't believe I've seen one in that range. I feed an HP-3336B into the crystal jack. I can enter any frequency I desire.

I have a variac controlling the plate supplies on both the T3 and the 610E.

Allows operation down to well below 50 watts.  Although I have not tried to adjust the modulator bias for linearity in that extreme.

there is no room in the HO17 shelter for much in the way of additional gear.besides , i enjoy operating the BC610 in the way it used to be.
we are limited on ERP , so the BC610 into a whip is well within this. someone must have an xtal around that freq band. i could grind one of my existing ones , but they are a long way below. it is not all that hard tto do , just time consuming . cheers, alan

There was a BC-610-E modification program done by the British army back in WWII that allowed 6dB and 12dB power reduction to be carried out, along with reduction in the modulator bias and audio input to the BC-614.

They didn't do that over here, and I'm not going to modify the whole tamale, just to get on one obscure band.

Especially when over here it is USB Only. BC-610 won't do any form of SSB.

I've listened to these obscure bands with weird power, channelization, and power limits.

I just don't find them to be of interest to me.

Others may be so inclined.

why dont you use the 2532.5 xtal x2 then you are in the range for 30Mtr
i think this it is in the bx-34 box?
i am using a dds for 160/80/40/20 Mtr for the freq were i dont have a xtal for .when you are tuning in good on a ssb station they dont now you are in AM

10130 kc/s puts him a bit near the data section of 30m, Jan. Better to find a 2500 kc/s and grind it up in frequency a little.

I think Alan is after CW only on 10Mc, as we're only allowed SSB on that band for emergency comms, otherwise its CW and datamodes only. Just a thought anyway as it's a great band for CW and no contests, a real bonus!

hello , you are quite right roger.i have little interest in ssb . it might be a bit of fun to try it on 20 though. i used to do that a lot with the 53 . they usually remarked on my high resiidual carrier !
i did grind a 5040 one , and mis judged the time so it went up tp 10190 . i rubbed some solder on it to bring it down , and that was that. no more activity .i never realised that you could multiply the frequency by 4 in the BC610 . i suppose i really ought to get a little synthesiser , but the trouble as i see it is that onreceive you would hear it .
cheers, alan

That "should have worked.

It should have given you output at 10597.5 MC.

Something is out of whack in the tripling stage or the crystal needs opening and cleaning.

However, the FT-171s are known to crack. Age takes its toll.

Alan,

These old gals don't do a quadrupling of crystals.

They either do X 1, X2 or X3.

If you are trying X4, it isn't going to work.

Alan,

You'll want to set the output to 2V peak to peak.

That is the "magic" number to feed the crystal socket with a synthesizer.

That's what a couple of us are doing with an HP-3336B over here.

You have space restrictions, we are running the beast in our shacks. So
we don't have the space issue.

I got mine for a whopping $80 USD. It was still in calibration.

Bill,

Not a single one.

Use the 75 ohm output, the right size WECO connector, and run either
RG-58 or RG-59 to a crystal holder that has been gutted.

The length of three or four foot of coax and 75 ohm output won't even be
noticed.

The idea that some have put out about bringing the 50 ohm from inside
the attenuator to the front are a waste of time and effort.

10 DBM output gives you the 2V peak to peak that the Beast wants into
the tuning unit.

Do you have all the manuals?

Alan,

Yes, I'm sure we'll all be interested in how you get on, 18 is a good band for DX.

I bought a collection of FT-171 rocks on ebay a while ago, just really to populate that crystal box I got from you. There were a few rocks for the BC-500 radio which were low frequency, I think, anyway they were no use for my BC-669 or BC-610, so I gutted them and mounted a BNC socket, a 10X and 10XAJ combined socket, a FT-241 and an HC6/U socket as well, on the back of several FT-171 cases, so that I can plug them into the TU and get good firm contact. The 10X will fit the FT-171 socket direct, as you say, but early 10X rocks sometimes have very slim pins which don't make good contact with the TU socket.

If you can't find a rock, let me know, I have hundreds and might even have something in the right area ;-)). A number of my rocks for 80m are those little (?HC-43?) type I bought from Bryn/AF4K. Despite being tiny, they work well in my Beast, inside an FT-171 box. Also have a load of HC6/U on the low end of 80m CW, all ex-Pye Westminster and milspec.

Jan,

The problem with Alan's setup is that his is the entire communications shelter as left in Europe after WW2. So he doesn't have much space at all inside.

WB2FCN and myself both have HP-3336Bs. But we are loke most of the BC-610 folks. We don't have the whole shelter full of gear.

The only question is whether the Tuning Unit can get above 18Mc.

The PA coil is also designed to go "up to" 18 MC.

The only thing left is to put up an antenna to resonate there.

The only question is whether the Tuning Unit can get above 18Mc.

*This perhaps can be made to work with the TU-54 by adding a fairly small disc ceramic capacitor in *series* with the air variables.*

I've used fairly small disc ceramic capacitors in parallel with the 2.0 to 2.5 TU to get it to go down as low as 1.6+ MC.

The PA coil is also designed to go "up to" 18 MC.

*If this coil could be "shortened" just a tad, about 1/4 turn, it may make it.*

This PA coil is for 14MC to 18MC. (perhaps 1/4 turn more or 1/4 turn less. It would take some experimentation. Also depends on whether the link is fixed or if its adjustable. Adjustable would be preferable for experimenting.)

The only thing left is to put up an antenna to resonate there.

Bob - N0DGN

We are restricted to CW from 18.068 to 18.110. Then we can run phone
from 18.110 to 18.168.

Doesn't seem worth trying to even put up an antenna for the 58KC of
phone bandwidth.

Just my $0.02 worth.

Check the rules but I think, like 28.3-28.5 that its USB only.
I can't verify this while on my phone, on the road.

Hi Geoff,

That's the disadvantage of having a band plan enshrined in your licence conditions. Our band plans are advisory but not compulsory. Having said that, I doubt I would use AM on either 18 or 28 MHz, unless I wanted to QSO lots of Russian taxis!

No sir. The 18.110 through 18.168 is simply phone and image.

Turn a BC-610 loose and talk if you want to put up an antenna for it.

No "funky" restrictions.

Alan - Here is the info on the Beast going on 10 meters.

It comes from WB2FCN.

Bob,
It will go to 10 meters, however you need to make a 10 meter coil and output coupling coil, (usually on one coil mounting bracket), and adjust/readjust the neutralizing cap for operation there. The coil MUST be heavy duty, about .25 inch diameter copper tubing, which means it just needs to be formed properly, but doesn't need plastic support bars to hold the turns spacing.
The 18 MHZ, tuning unit would need to be modified also, a grid dip oscillator would help to get in the right neighborhood. I made one for a guy in down state NY a Ham, he wanted to blast the CBers that were wiping out his TV, he lived in a rural area, and the clowns were running illegal high power radios. So he bought a BC-610 and had it sitting on a ground mounted vertical antenna, in standby, when the 'Good Ole Boys' came on wiping out the local TVs he would key the thing up and 'Querm' them until they went away.
Be real careful with 10 meter operation of the 610, there is a good chance for everything becoming 'RF Hot' metallic surfaces with zap people and animals just like a small lightning strike, but it is RF burns and takes a bit of time to heal.
If I remember correctly, the plate portion of the coil was 3 turns each side of center, and the output side was 2 turns. The spacing was .75 inch.
Jim

My T-368E has the support frame (they seem to have often lost these along the way)

In OE configuration, it was not for purposes of rolling; it was to bolt it down and to have a
series (I think a total of 8) honkin' big shockmounts between that mount frame and the body of
the TX. You'd spend a fortune to actually get the number/size of shockmounts involved, unless
you bumbled across some used ones.

It does represent a very stable thing to put casters on. I drilled mine and did that, though
now I realize that maybe I should/ could have found a no-drill option; I suppose the holes
could be filled.

It would be hard for me to take complete photos as the TX is on it and would be a beast to get
off it, but I could take some photos, and could take some moderately detailed measurements,
from which you could probably create a "passable faux version" and use wood blocks where the
shockmounts would've been.

Would that be of help?

A good alternative to using casters for large flat-bottomed heavy things that don't have a support frame is to get a bunch of "ball transfers" like eBay item # 270851313310

These 1" units are typically rated at 75-100 pounds each, and if you have a used material handling equipment dealer you can probably get them for couple of bucks each. Screw 'em into a piece of 3/4" plywood and get the local gorillas to hoist the rig on top and you're set. Lower height keeps the center of gravity low and it spreads the load more evenly, plus eliminates the need for a steel support frame.

hello Groep

this week i pickt up a bc610-I in a barn.

it was there for 25 years in good condition but with
no back plate and many dust Hi

when i have time this week there wil be some power on
it slowly

Congratulations! That's an even better deal than I got with my 'I model', which has a back panel. I paid $50 for it and the fellow delivered it, unloaded it and helped me get it in the shack.

Subject: Re: [T-368_BC-610] idea using HP3336B

Bill,

Not a single one.

Use the 75 ohm output, the right size WECO connector, and run either

RG-58 or RG-59 to a crystal holder that has been gutted.

The length of three or four foot of coax and 75 ohm output won't even be

noticed.

The idea that some have put out about bringing the 50 ohm from inside

the attenuator to the front are a waste of time and effort.

10 DBM output gives you the 2V peak to peak that the Beast wants into

the tuning unit.

Do you have all the manuals?

hello guys, i was told an interesting story yesterday. the person concerned , a radio amateur, was installing microwave links in saudi arabia in order for remote villages to be connected to the telephone network. he wished to get an answer for something and made enquiries as to how it was to be conveyed to head office. he was told to send a telegram and directed to the telegraph office.
there he found a BC610 in excellent condition with all coils and tuning units etc.they sent his telegram in morse and soon gave him the reply. this was in the late 70s . he wondered how it got there , and what happened to it.alan G4GEN

hello guys, i was told an interesting story yesterday.....
I heard an interesting one also. A friend Cecil Royce (SK) said he was an Army radio operator in WWII working a BC 610 that was mounted in a bomber with the bomb bay modified to hold the generator. They hopped across North Africa then up into Italy where the flying BC610 ops were halted. Their drill was to land at improvised or remote airstrips, drop the generator, set up antenna poles, then operate contacting both Bomber Command in England and the US. Cecil wrote it up but I've never seen any pictures.

Hey Jim,
Thanks for the reply...Well now that's tempting!
You know, if I hadn't recently finished the restoration of the donated 610H I received from Bill Kish I would probably be all over it!

610 Twins!

In my small, modest shack, I would have to demo into the garage for the added space.
Take a quick look at you tell me....

# 5340. BC-610 For Sale

Yahoo group: T-368_BC-610
Date: 2012-09-12 17:23:28 UTC
From: Chuck Hurley
Topic: 5323  Message: 5340

To all,

I have a very nice BC-610 with the BC-614 speech amplifier and BC-939 tuner. BC-614 includes all cabling and a muting relay box for the receiver. The BC-614 has been recapped and modified for use with a D-104. The BC-610 has only one modification and that is a BNC connector for direct VFO input. I have all the tuning units and coils from 1.5 to 18 mhz. All the coils have been repaired as needed with Garolite and epoxy to stabilize the coils. Includes a tailor made dust cover for the BC-610 and one for the BC-614. This a turnkey working unit that I have had on the air recently. Located in Massachusetts just south of Boston this is obviously a pickup only item but I can assist with delivery if it is in the area. Pictures available. Serious inquiries only. Chuck K1TLI 508-965-7400

Alan,

While I wasn't involved "that" far back, I do know that Operation Centers and communications centers had a "standard issue" clock that was in its own case that could be closed. These were a wind up type. They were synchronized either over a communications link either land-line, HF or in later days, (1970), by microwave.

Hello to the list members from a new guy.

I have a 610-I that been working FB on 75 meters. I recently tuned it to 160 and something is running hot. Smells like burning Bakelite during long transmissions. No viable smoke and so far the offending part just keeps hanging in there. I remember hearing somewhere that the final plate choke can run hot but mine looks OK with no sine of goopey insulation or distress. The output coil looks OK too.

Is there a known part that tends to run hot on 160?

Thanks,
Charlie K3YA

Charlie,

Yes. You are probably burning Resistor R9 and may be damaging PA Plate Choke CH10. Installation instructions for Frequency Modification Kit MC-509 say that for operation of BC-610 on frequencies between 1.0 and 2.0 MC you must disconnect one end of R9. R9 is located below the PA tuning capacitor adjacent to CH10. For operation above 2.0 MC, reconnect R9.

Robert D

The MC-509 instructions include modification instructions for Antenna Tuning Units BC-729 and BC-939.

Be sure that you crowbar the high B+ before you go digging around in the PA section. Fifty years ago this past Spring, I survived discharging the HV filter capacitors in a BC-610-E with an open bleeder resistor. But survival is not guaranteed.

As Robert Downs posted. You *MUST* follow the MC-509 procedure. If not, you will definitely cook components that will be difficult to replace. That specifically applies to the Choke.

Stop the 160 ops until you follow the procedure, which then *must* be reversed when operating above 2.0 MC.

Thanks. R9 looks like a likely culprit. I'll unhook it and see if it makes the transmitter happy.

Charlie,

Also check CH4 very carefully. R9 is a readily available component, whereas CH4 is *NOT*, and may well take the brunt of the problem. It can either short or burn open.

Yes, have seen that note in the MC-509 kit instructions. Understand the inclusion of R9 in the design which is explained in the TMs but R9 apparently overheats (and maybe causes other mischief) and must be removed when the 1.0 - 2.0 Mhz range components are installed. Presume the resistor is a non-inductive type, carries an X****designation in my 1943 TM, but why does it have to be disconnected for the lower frequencies? The resistor would be carrying the full PA DC plate current if CH-4 opened and would be dissipating something like twice it's 20W rating. Something to check out but not what the warning in the book is all about. So, if R9 gets hot it must be getting a significant RF voltage impressed across it.

In the BC-610 tank circuit the 180 degree phase shift in the RF plate voltage required for the neutralization circuit is provided by the split-stator PA plate tuning capacitor. The rotor is held at RF ground potential by C11 and the RF voltages on the opposing stator sections are of opposite phase. Theoretically, the "center tap" on the PA tank coil in the BC-610 configuration should also be at zero RF potential but in practice stray capacitance and inductance make this very difficult to achieve and so when the B+ is provided to the PA plate through the tank coil (series feed) this is typically done through an RF choke (CH-4 here) to accommodate any RF offset. (RF chokes, in turn, can cause mischief too which is what R9 is all about, see the TM.) So, it would appear that when the new, lower frequency coil and vacuum shunt capacitors were installed it was found that a LARGE enough imbalance had been introduced in the PA tank circuit to result in enough RF voltage appearing at the nominal center-tap on the inductor to roast R9. Couple of hundred volts RMS would be more than enough.

Anyone have a better idea?

hello , if you wreck the RF choke, i have a spare. i managed to find one on ebay . in the end i got a complete tuning unit and installed it. my choke blew up quite sspectacurlarly , which i found was due to using the wrong TU for 20 .
i would bbe most disinclined to run it on top band ! i love that old girl too much.alan G4GEN

According to LC Resonance Calculations, that particular "loop" of 2.5 mH, 630 Ohms, and the 55pf added across the PA Tuning Capacitor, you are at a harmonic point in the CH4/R9 area.

This would increase the current flow and create an issue of heating within this circuit.

The issue I have with the TM as shown on top of page 46, is that it does NOT show the 55pf Fixed vacuum capacitor across C12. This is indeed what should be shown.

Additionally, there should be a fixed vacuum capacitor inside the BC-939 if used in this configuration, and it TOO must have one conductor removed AND another jumper added.

I unhooked the wire wound resistor in parallel with the choke and now my radio smells great! It's a ceramic coated resistor mounted right up against the bakelite case of a capacitor so I suspect the excess dissipation was cooking the capacitor and giving off the smell. All parts seem A-OK and I even had a couple QSO's this evening it to test everything out.

It looks to me that the resistor is there to lower the Q of any resonant modes present in the plate choke. I bet the transmitter will work fine without it on most frequencies and it's absence will only cause an issue on a few higher frequencies that the choke doesn't like. I'll try the transmitter on 75M without R9 and report how it works. Currently 160 and 75M are the only tow bands that I operate on.

Thanks for the help.

Charlie,

I too have found R9 to be a ceramic coated wire wound resistor.

It certainly is not a non-inductive one as has been previously been suggested. Its proximity to the bakelite encased capacitor would indeed over heat both under use at that frequency range.

The TM simply tells you that this must be disconnected on one end. It doesn't go into the theory and reasons why. The TM is geared toward the operator, not a technical type.

Let us know as you continue operating how the results come out with leaving R9 open on other bands.

"Certainly" not non-inductive??? You can't tell just by looking at it, depends on how the winding of the wire on the ceramic form is configured. According to TM 11-281, CH-4 (designated CH-10 in early 610 models) is self resonant in the 2 - 3 Mhz range. Just what adverse effect this had is not reported. High RF voltage arcing across or within the choke could have been one result and PA neutralization problems could have been another. In any case the engineers chose to resistively load the offending circuit (i.e., lower the Q) down to a point where the adverse effects were abated. Straightforward solution but since RF is involved the use of a non-inductive resistance element would "certainly" be indicated. Finally, TM 11-250, 22 June 1943 lists Utah as the manufacturer of the majority of the 20 watt resistors used in the B, C and D models. All of these resistors carry a Utah 20VWQ type code except for R9 which is a Utah type X1022. Sure is something special about it and I'll put my money on non-inductive.

# 5359. BC-610 T-213 Heat issues

Yahoo group: T-368_BC-610
Date: 2012-09-19 17:22:41 UTC
From: rbethman
Topic: 5359  Message: 5359

Group,

Looking at these transmitters, their former installation in the communications shelter, and the "most likely" installation in our Amateur Radio shacks, (That being with the backside probably backed up to a wall.), has caused me to start thinking about the cooling of them.

The ventilation of the transmitter has been done by convection cooling for all these decades. I wonder about the effect of the heat on all the components. No one ever envisioned this length of life when they were designed.

The major ventilation of the transmitter is by the holes in the rear of them. (One of mine DOES have the back cover - the other does not.)

It starts the thought process as to whether these would benefit from some sort of forced air cooling, whether by drawing air out, or pushing air in.

Has someone else been chewing over this besides myself?

Your reference is on "earlier" models than the "H" and specifically the "I" that is being discussed.

The later models come under TM 11-826. This is for "E", "F", "G", "H", and "I" plus T-213/GRC-26.

Therefore you aren't even in the same manual nor manufacturing variants.

Try page 123 for the parts list indicating the description for both R9 and R20 on the LATER models. The manufacturing Order Numbers indicate 1950.

You aren't even in the same ballpark with references that do not apply to the entire later series, whose TM is dated October 1952.

No "special" note is made regarding what type or whom made these two components in the later manual and models. They are indeed specified as JAN types.

K3YA and myself are talking specifically about the "I" variant.

Whatever... You still can't tell just by looking at the externals of the resistor and the use of a non-inductive unit for the resistor in question would be indicated whatever model was involved. The model suffix letters and TM dates don't change the relevant technical and the engineering issues.

Obviously you aren't interested.

This would be indicated by the "Whatever.....".

Technical and engineering issues indeed change with model changes. The specific models have had circuit changes as they progressed. The "general" theory did not change, but the specifics did.

Their are significant differences between the B, C, D models and the F,G,H, I and T-213s. The T-213 was coming out of Depot in 1959 as so indicated by the stencil date on the front panel.

The schematics and parts used are specific to the model in question. Why else would they take such time and effort to draw the different drawings, AND specify *different* components based on MODEL?

The different "Variants" even used a different value for resistance and wattage depending on "Variant" and further down to serial numbers specified.

R9 at 630 Ohms 18W vs R9 at 700 Ohms 16W makes a difference in the resonant frequency while CH4 values did NOT change.

It is apparent that engineering changes were dictated by past experience as reported from the field and failure reports.

This indeed did not change "general theory", but did change the characteristics of the circuit.

Therefore there is indeed a necessity to be very specific about which TM, "Variant", and Serial Number when trying to discuss the issues that are pertinent.

The resistor in question apparently still in place in 1959 just as in 1942 and 1945 so the same problem with the circuit still existed in 1959 and apparently persists as of 19 Sep. 2012, notwithstanding advancing model letter designations, TM dates and front panel stencils . The use of a non-inductive resistor would have been the engineering choice in 43, 45 & 59 and remains so in 2012. Also, you can't tell if the WW unit is inductive or not just by external inspection unless, happily, it's identified as such by a printed label or an unambiguous and retrievable part number. Again true in 43, 45, 59 and 2012. Now, does anybody have hard information here? Apparently none of the TM's do. In 43 the thing was a Utah X1022 but I can't find anything on that in my library. Again, different from all the other 20 watt units listed in 43. The thing apparently got a JAN ID later, but again, non-inductive type? Anybody have hard information on that (or give a damn)?

Just to be clear I'm a T-368, not a BC-610 guy but I've assisted and advised several other 610 owners and am very familiar with the radio which is not rocket science in any case. BC-610 owners are free to believe whatever they want concerning their property. My interest here was a particular technical puzzle, take it or leave it. I'm out of here...

Duh, let me make sure I've got this right: The frequency of a resonant circuit is determined by the resistive component? Wow, I thought L & C were the important parts and R only had something to do with the Q maybe? Now, if your major "R" component is a common WW resistor the inductance that comes along with such wire wounds will affect the resonant frequency WHICH IS WHY YOU SHOULDN'T USE THEM IN RF CIRCUITS!

There is an impedance as part of the Resonance calculation.

Impedance IS part of the resonance whether we care to think about it or not.

Whether it is inductive or non-inductive doesn't matter.

The software I use has them both calculated at the same time, even
though I didn't go looking for the Impedance.

Thought you were leaving?

Hello Dennis from N3BQW (my old call)

I was thinking that a plain old "inductive" wire would made more sense in this application. All those resistance wire windings would have considerable inductance and thus it would act as a second choke, with very different characteristics, in parallel with choke ch4. A non inductive resistor with such low resistance would nearly short out ch-4 as far as RF is concerned.

Anyway, I haven't tried it out on 75M yet.

Bob, what Dennis wrote is correct. There were a lot of cosmetic changes from the E through the I (the T-213/GRC-26 is just an F through I that went through Depot, got an MWO applied, and had its nomenclature administratively changed - not a new transmitter - I owned four of them at one time). The manufacturer's numbers on the various components changed in part because the contractors or contractor's bookeeping changed and some subcontractors got swallowed up or went out of business. But the circuitry that has become the point of contention is, allowing for changes in production methods over the two decades, substantially the same in all models. And the field mod required for operation below 2 MC is the same in all models from HT-4 through T-213 (except that the HT-4 didn't come with a civilian version of either BC-729 or BC-939 because hams didn't use it as a mobile rig).

hello guys, i do not have a TM for the BC610 , but do know one thing. when i got the almost new looking PA tuning unit for mine , i had a good look at it. R9 was 700 ohms and appeared to be a wirewound vitreous type. this surprised me as i assumed that it would be non inductive.
my original one did not have the resistor , which probably contributed to the failure of the RF choke . however it had worked fine all those years . the tx is an E model. what killed it was operaring on 40 metres CW it high power. alan G4GEN.

Rest your case on what?

Tuning the Final PA section to Resonance, while indeed being L and C components, Is tuning to the Impedance of the antenna system, which is designed for a narrow frequency range.

Impedance is indeed a "part" of the issue.

Why else is an antenna "Matchbox" used with a generalized antenna system? To match the impedance through another L C Network.

Does it actually "Match" the impedance? No! It takes one impedance input, and presents the output to the generalized non resonant antenna to make it appear to be "matching" the impedance of the antenna system.

Or have all forgotten what the tuning of a final section is doing?

The BC-610 series is specifically designed for a 50 Ohm output.

Please revisit the entirety of tuning for resonance.

R9 is physically located under the PA chassis, in a string of components leading to the air variable PA tuning capacitor.

You'll most likely have to get out a flashlight to be able to locate it, and be able to clearly see it.

You will also see that it is parallel to CH4, and adjacent to two bake-lite encased fixed capacitors.

Yes sir! And we STILL know how to RTFM!

Thereby we continue being able to read, operate and maintain them.

RTFM ??
Read The F’n Manual??? After 48+ years in the Military comm biz I understand that. Had not planned 160 ops but was given the coil in a trade. The coil itself is still in the military foil stuff inside a box. The manual I have is for GRC-26 so will search for reference to using the coil or operating the I model on 160.

Mark,

The manuals will not of course say anything about operating any model on 160. The modification instructions are in the instructions for using Frequency Conversion Kit MC-509 (1.0-2.0 MC). They are in Change 1 to TM 11-280. They may be in either the final TM 11-281 or in one of the supplements and may be in TM 11-264 but I doubt it as I doubt that MC-509 was used into the Korean War. I don't have the energy to climb into the attic tonight to look.

The MC-509 instructions are in TM 11-826.

They are most likely in the earlier TMs.

Jan,

You can usually manage to rework the coils.

It depends on what is distorted. By using the waxed nylon string that is used in tying the wiring harness.

My 160 meter coil got out of wack not long after I unpacked it from its foil wrapper. The fixed link became offset, and no longer evenly spaced.

I've got some bamboo strips that I'm going to use to make that concentric once more.

I'm also going to take a careful look at what the brown frame is made of. I may just cut some Phenolic sheet to rework the coils.

Topic: 5393  Message: 5393

hello steve, you're telling me ! we had to change most of the caps in the 312.what took out the psu in the last 342 was catastrophic capacitor failure when i was out of the shelter working on an external antenna. i saw smoke coming out and hurried in , but it was too late. the psu was in a terrible state from the pitch of the transformer. i have obtained another psu which suffered a similar fate , but the owner spotted it in time. the transformer is being rewound , and i hope to have that rx going this winter. all the caps will have to be done i expect , as it is a dead short on the ht .
that rx is a really beautiful one ,made by farnsworth and looks like new. i replaced the original 342 which came with the SCR399 with it as that one did not look all that good.although i only had to replace the function switch .
we got the outfit from jan and fetched it home from arnhem . i reckon that was one of the best things i have done for years ! alan

You may find, as I did, that the 2-3 MHz coil along with a 50pF vacuum cap work better on 160M then the 1.5-2 MHz coil. The Q on the 1.5 MHz coil is pretty low and doesn't give good coupling to the link coil. I could only load my transmitter to 150mA with the link set for maximum coupling and a 50 ohm load. On the other hand the 2MHz coil runs at a higher Q, gives better coupling, and I can run as much power as I want without maxing out the swinging link.

I have looked, and I do NOT have a 2 to 3 MC PA Coil. Although I do
have that TU.

I managed to get that TU to go down to 1.6MC by adding a fixed disc cap
in parallel with the internal air variables.

The specifics are:

a 100 Pfd silver mica across each vari cap in each section of the tuner( TU-47).

OK Alan,

There is a procedure to adjusting RY5 to get the correct trip current value (page 98 of TM-11 826 covers this) by altering the armature spring tension using a battery, meter and potentiometer. I would be careful to ensure that a rewind doesn't compromise the trip current to the extent that you can't get full anode current, especially if using a modern metric wire gauge.

I have found it very difficult to get my RY5 to trip in service as I run the BC-610 from a 110V site transformer and don't get off-resonance HV plate current over 400ma. However, it did trip when I had an 866 flash-over, so it is working.

Does the HV come on if you short the RY5 terminals? (On HV protect for safety)?

I have a couple of fixed link tank coils which i believe are for the BC-610 (?). They cover the range of 2.0 to 3.5 Mc, coil # C-387-B by EF Johnson. Both of these are like new, no cracking or destroyed plastic coil forms. Nice shiny copper looking winding. Two off them came out of the box which was deteriorated quite badly but the inner wrapping was still sealedl!. They indeed do look like they are brand new items. In my haste to get them out of the wrappings i acted like a kid at Xmas time and tore the sealed package rather than cutting it open along the seal line. Well i was a kid once and do remember doing things like that.

Anyone interested? I also have numerous tuning units but alas, no BC-610 to use them in. More than likely within the next couple of years they will end up in the dump as i'm trying to clean out the garage-storage shed-spare bedroom. If no one wants the stuff there is no reason for me to keep it. Sad but the reality of life.

I've contemplated the same thing, though I haven't tried it yet. I think that the two most obvious choices would be to either mix the R-390A audio and the sidetone externally with an outboard device, or inject the sidetone into an R-390A audio stage. I wonder if it would be tricky to get the sidetone volume to roughly match the receiver audio volume as signal conditions and the volume knob are changed?

From: Ken Schwieker
Topic: 5404  Message: 5406

Something that would work is a small audio
transformer with one winding to match the R-390
audio out, another winding to match the T-3
sidetone out and a third to match the headphone
impedance. I would think matching would not be
critical. If all are 600 ohms a typical phone
patch transformer should do. A volume adjust pad
to be able to adjust the sidetone or receiver out
volume whichever is normally higher (or both) would be good.

Well color me stupid! My father would have given me you know what! Pin H on the remote plug ( T-368, J-12) is sidetone out...and...what for it.... pin H on the remote plug (R-390, J105) is sidetone IN... it is coupled directly to the headphone jack & the local audio output of T-602 in the R-390. If you don't have the mating plug for J105 on the R-390, it can also go to pin 6 of the J102 terminal strip....

Whew! Sorry Dad!

From: cosmo224
Topic: 5415  Message: 5415

Hello all
I have a B&W T3-C that I picked up several years ago and I have finally been doing some work to put it on the air. When I got it originally, it put out power in the 400 watt range. Due to other distractions I did not get to fire it up until recently.
When I recently tested into the ME165 meter/dummy load, the PO was around 200 watts so I went through a tune up cycle.
Now, when I key down, the HV breaker trips. So wondering if this is an arcing issue? Is there a good first place to check? This morning I decided to let the rig do a burn in so let it run for an hour with only filament voltage on then turned on the plate and just let it run/idle to burn out the cobwebs. Any thoughts or input would be appreciated.

YES!!

Go to the files section on this list and read the "start-up" notes.

Clean, clean, clean.

Check the HV wiring for cracks.

Check the spark gap on the big capacitors on the power supple deck.

Check that the main tuning agrees with the power amp tuning.

Check all of the interlocks, the wires going to the interlocks and the function of the lock itself.

Ask more questions,

Joe

Topic: 5415  Message: 5417

Hello
Thanks to Mac and Joe for their input - The rig will get a general checkup
for cracked wires, oil, etc (and some new bearings for the fan)
The fix came from Mac W7QHO who gave me the working stats
for his T3 in terms of PA current at key down durning TUNE/OPERATE.
I originally tuned my rig to 150 ma PA current and now I backed
the loading down to where the current was just around 100 ma in
the TUNE setting.
On keydown, the power was just under 400 watts - I tried some
different load values and at one point I was above 400 watts
but am ok now just above 375 watts and no circuit breaker/overload
tripping.  Next up - audio mods to take the clipper and a couple
filters out of the talk path.

Thx es 73
Mike

From: k3pid
Topic: 5418  Message: 5418

OK, My T-3 will load nicely into a dummy load ( 50 ohms ) on 40 meters ( 6.0 - 11.0 )with a well defined dip and easily set loading. All the numbers work out right but I can't get a good resonance on 80 meters ( 3.0 - 6.0 ) into dummy load. The tuning dip is fuzzy at best and outside the chart limits. Any first thoughts? I am assuming the a 50 ohm load is correct...

Ron,

Are you getting your "fuzzy dip" while still in the TUNE position or after you switch to operate? Know the book says to adjust first for 150ma dipped PA current with the switch in the TUNE position but that's too much in my experience with a pair of these beasts. Can't get that much PA current in TUNE with my "Basic", in fact, and I just helped another fellow who was starting out at 150MA and then consistently kicking his breakers when he tried to switch to OPERATE.

I start out at 80-90 ma dipped in TUNE and then switch to OPERATE which gives me abut 200 ma PA current and 350 watts out. I then touch up the loading to the output to I want (keeping the PA dipped of course). Check your grid current along the way too, of course.

OK Mac, I tried with a lower value and got a reasonably sharp dip with 90 - 100 ma in tune and that translated to about 300 ma in operate ( CW on 3570 kHz ). Is this a function of the 4-400 internal capacitance? What are your thoughts on a possible cause?

Thanks for the help!
Ron K3PID

Topic: 5418  Message: 5422

Good question. Probably nothing to do with the inter-electrode capacitance values in your 4-400. More likely a function of your line voltage, the model number of your PS (later versions put out higher voltages and a lot of drawer swapping apparently took place at the military maintenance depots), whether or not you're using 3B28s or the later solid state replacements, and drift in the value of the big dropping resistor down in your PS that's cut in when you go into the TUNE mode. I ran mine for years before I got a look at how the military did it. Just tuned it up like any other medium powered class C amplifier which is what it is. I run mine on phone almost exclusively, BTW.

How much power are you getting out at 300ma? Do you have the companion ME-165? Very useful accessory.

Especially since the settings for the BC-939 are both in the manual AND
on the cards located in the pocket on the front of the transmitter.

What happened with the T-368 and the TN-339? Everyone suddenly get NOT
smart?

My T-368C is missing the tuning chart cards and the metal pocket (mounting holes for it are on the side of the radio), as well as the T-shaped hex wrench that fits in the clips in one of the handle cutouts. I would like to find originals for all of those one of these days. I bought a T_shaped hex wrench from my favorite industrial supplier, but its handle is much too wide to fit in the storage area.

Hello All:

My name is Don and my call is WC4D. I'm new to the group but I've enjoyed looking at photos and reading post. I am new to AM also. I started into it this summer and I have a Viking ll as my starting radio, but I wanted more output and I ran into a deal for the B/W T 368C I have now. I've not yet to fire it up as I'm reading and learning as much as I can about it before putting it on the air. I know it's in working order and ready to go,so it's just getting some wiring done to feed the beast and getting my R 390A read to recieve. I know if I have any problems that I can come here and find some help and that's always good to know. I hope to work as many as I can of your and and catch you on the AM nets ..

73 Don WC4D .. Happy New Year

Welcome to the group! The T-368C and R-390A are a great pair of radios for AM operations.

Those that need the items mentioned in the subject, go to Edebris and download TM 11-809.

All of these are in this manual and begin on page 19.

Topic: 5430  Message: 5430

Hello All:

I recently joined the group with the hope that I will learn enough about the BC-610 to make intelligent decisions regarding purchase, restoration and operation. My bio can be found on QRZ.com, so I won't repeat it here.

My interest in the BC-610 is a personal one: my father served as a radioman in the Army Air Force during WWII. He served in the Pacific Theater and operated the BC-610. He'd mention the beast every so often, and usually in the context of how difficult it was to keep it running in the tropical climate. Anyway, I'd like very much to get one of those units and put it on the air in remembrance of my father.

One thing I'd like to know is what version of the radio he might have used. Dad is gone now, and by the time I got around to showing him photos of the two main variants of the radio his mind was too far gone to remember. I'm hoping to get one that physically looked like the one he would have used: the earlier A thru E suffix units or possibly the F and later models.

I'm hoping to get one that physically looked like the one he would have used: the earlier A thru E suffix units or possibly the F and later models. If anyone knows approximately when the F-models went into production that might help me zero in on what style Dad might have used. He entered the service in 1942 and served until the end of the war. Although he was discharged in 1946 he got back to the states in late 1945, so he probably stopped using the '610 around that time.

Thanx in advance for any information the group can provide.

Jim,

This would be a tough one to try and give a definitive answer to.

The BC-610 registry is on the Group's website under databases.

The "E" models have dates of manufacture beginning in 1943. There are
"H" and "I" models with '44 and 45 dates, and others into the '50s.

They then took them in for modification, and released from Depot in '59
as T-213s.

The "E" and earlier models have a "singular" look, whereas the remainder
look all identical.

Since your father was in the Pacific, one could only speculate that
these were "later" models.

All of them were shipped from the US in a panel truck towing a trailer
with a generator. Later ones were sent out on the rear of a 2 1/2 ton
6X6 also towing a trailer with a generator.

Believe it or not, these were still in use through the '60s and even '70s.

Jim,

The BC-610-F was built post-war, I think in 1948 and 49. So he wouldn't have used it. Which is unfortunate as I have a rebuildable -F available.

The majority of BC-610 production was of the -E model but if he went to the Pacific in 1942 he most likely started out anyway with one of the earlier models. The earliest -E TM I have is dated 4/17/43. TM 11-280B on SCR-299-B (and BC-610-B) is dated 10/22/42. Unfortunately I don't actually have any of the single letter manuals. Only the one covering SCR-299-A/B/C/D which was issued 6/22/43.

Hi Jim,

Welcome to the group.

I can well believe that your father would have had real problems with the BC-610 in such humid climates as found in the Pacific as essentially the HT-4 amateur radio model was designed for a warm and dry ham shack or in a room in the house, see the film "Voice of Victory" which is downloadable on the net and you'll see that the changes for military use were very basic and certainly didn't include any extra water-proofing!

The HT-4 was also used commercially pre-WW2 but again most likely it would be well housed. I dare not fire up my BC-610-E in damp winter conditions without letting it thoroughly dry out first, by running the heaters for a good while beforehand.

Best of luck finding a Beast!

# 5437. Re: [T-368_BC-610] T-3 Final tuning issues

Yahoo group: T-368_BC-610
Date: 2012-12-31 02:48:14 UTC
From: mac
Topic: 5418  Message: 5437

Ron,

I've wired around the clipper and filters in the speech amplifier and replaced the C41, C42 and C7 combination of capacitors in the PA tank circuit with a single .001 mfd unit. (Note: these three caps may have different designations in different models and sometimes have been replaced with a single, large .004 mfd unit.) I also reduced C10 to .001 mfd. The main "problem" with stock T-368 audio is that the design of the pi-L tank circuit in the PA results in about 7000pf (.007mfd) shunt capacity across the secondary of the modulation transformer which, in turn causes the audio response to be about 5db down out at 3kc. A couple of db improvement can be obtained by the substitution described above. After doing this the transmitter probably won't work all the way down to 1.5 kHZ anymore but still OK on 160M.

The popular "Timtron" modification (named after Tim Smith, WA1HLR) feeds B+ directly to the plate of the 4-400 through a high impedance choke as per conventional ham designs. RF is fed over to the pi-L tank circuit through a 500pf coupling cap, C41, C42 and C7 (or the equivalent single cap mentioned above) are eliminated and, of course, and C10 and L3 are also disconnected. At least a 250 microhenry choke should be used here if the rig is to be run on 160M and, of course, the choke must NOT have any series resonances in any of the ham bands to be covered. The common B&W 800 is not suitable here BTW (not enough inductance).

A note on the original design of T368 plate tank circuit. It's very difficult to make a choke with a lot of wire on it that isn't series resonant somewhere in the HF spectrum and most wide range transmitters bandswitch plate chokes in and out too along with other tank circuit constants (T195 and GPT-750 for ex.). In the T368, however, feeding the B+ in at the low Z end of the pi section allowed the use of a single, low inductance choke. The engineers were apparently able to find (or design) one without any series resonance points ANYWHERE in it's 1.5 - 20 MHz range. Elegant design overall.

Actually, the T-368 doesn't sound half bad without any modification. An amplified D-104 with it's rising response characteristic connected to the 600 ohm input on a stock unit sounds very good. Cut the clipping way back too, of course.

Hope this is helpful.

My sincere thanx to all who responded; your information was quite helpful. It appears like I will be looking for one of the A thru E models, which is what I hoped Dad's unit would likely have been. I like the more "buzzardly" looks of the earlier models as compared to the F and later models.

Now that I have a better idea of what model I'm after I guess it's time to start the hunt for a suitable unit: an A thru E model that's either complete and working, or at least complete and restorable. Price will largely determine what condition I'll have to settle for, since funds are not unlimited. I'm great with electronics but not so great at cosmetics, so no rust-buckets or units that have been worked over with a blowtorch or sledge hammer. Candidate units will have to be within reasonable driving distance of NJ (meaning somewhere I can get to and back preferably in a day, or one overnight at most). Pickup at Dayton would be a possibility, since I plan to go this year. I'm in no hurry, so I am willing to hold out for the one that I believe would be right for me.

As I continue my research into these units I'm sure I'll have more questions for the group. Again, thank you.

73,
Jim

Happy New Year to the group!

I have a question about hearing the exciter on the receiver when in the receive mode. It is faint but does not help when trying to copy a weak station. Is this common? If not any suggestions on how it could be eliminated?

Thank you
Paul

Paul,

Ah yes, up through "C" models at least the PTO runs continually. After that it was keyed on and off by a pair of relay contacts down in the middle drawer. There was also a switch up on the RF chassis of later models that allowed selection of either continuous run or keyed PTO. Off the top of my head I'm not sure just when the change took place. The "C" I used to have included the change less the switch. From the placement of the added wiring and general workmanship probably done by a previous ham owner but could have been a military field mod.

The "Basic" I use now is unmodified. I can only hear the PTO if I disconnect the antenna from the transmitter and turn the receiver gain wide open, but only very faintly even then.

What model do you have and how bad is the problem?

Mine is a C model, and I haven't noticed the exciter when receiving. I'll try to remember to see if my PTO runs all the time this weekend, and if I can hear it in the receiver if I go looking for it.

Hi Dennis and Happy New Year

Thank you for the reply and info. Mine is a E model and the carrier is rather strong . Makes copying a weak station very difficult. I will switch off the plate when trying to copy a weak station. I'll have to find this switch on the RF deck you mentioned. I'm guessing it would maybe be on continuous run for RTTY operation. It's nice for spotting but it would be nice to be able to shut it down when not required

I have the 368 back on the air again so you and the other on the Mil Net will not have to strain to hear me on my puny TCS :>). Missed you last week, hope to hear you on tomorrow.

later models that allowed selection of either continuous run or keyed
PTO. Off the top of my head I'm not sure just when the change took
place. The "C" I used to have included the change less the switch.
From the placement of the added wiring and general workmanship
probably done by a previous ham owner but could have been a military
field mod.

The "Basic" I use now is unmodified. I can only hear the PTO if I
disconnect the antenna from the transmitter and turn the receiver gain
wide open, but only very faintly even then.

What model do you have and how bad is the problem?

There was an official MWO (I think thats what they were called) to modify fielded units to fix this problem. Unfortunately I could never find a copy of it. Fortunately my basic model does not seem to have this problem. If anybody out there has a copy of the MWO I would like to see it.

Happy New Year to the group!

I have a question about hearing the exciter on the receiver when in the receive mode. It is faint but does not help when trying to copy a weak station. Is this common? If not any suggestions on how it could be eliminated?

Thank you
Paul

Actually, there were two, depending upon letter model and Order Number. MWO 11-5820-258-35/3 applies to T-368A, B, D and to C on Order Numbers 28597-P-55 and 43056-P-56. MWO /6 applies to T-368C on Order Numbers 28459-PH-55 and 21316-PH-56. I actually have MWO's /2 through /6. Unfortunately, a Remark in /6 says /1 must be applied prior to or concurrent with /6. I don't have /1 or its title. I have a DA PAM 310-10 (List of tech pubs incl. LO and MWO) that doesn't show anything for the T-368 and one (actually a different pub number) from 1966 that lists /2 through /6 but not /1.

The list of parts required is the same in both MWO's. Both MWO's fix two problems, one being the oscillator radiation. If you can locate the keying relay and see the solder terminals, if there are 8, the MWO hasn't been applied. If there are 10, either it has or the transmitter was built with the change. There is no mention of an Option switch. The fix is to replace the keying relay with one having an additional set of NO contacts.

I didn't examine the T-368/URT schematic to see whether it was originally built to disable the oscillator or not.

My T-368C has a plate on the front that says it has the /4 MWO. The plate suggests that the /4 MWO makes it necessary to press the PTT switch to talk, so I gather that it has something to do with the keying and/or audio path. I haven't noticed any markings on my transmitter indicating that other MWOs have been done to it.

That is correct. It stands for Modification Work Order, and the same term is used for other stuff such as my military trucks, too.

Sorry, I should have just quoted the entire title. I'll list the entire bunch.

MWO 11-5820-258-35/2
MODIFICATION OF RADIO TRANSMITTERS T-368/URT, T-368A/URT, T-368B/URT, T-368C/URT, T-368D/URT AND T-368E/URT TO PREVENT BURNOUT OF THE INTERMEDIATE POWER AMPLIFIER PLATE TUNING ASSEMBLIES AND TUNING CORES.

MWO 11-5820-258-35/3
MODIFICATION OF TRANSMITTERS, RADIO T-368A/URT, T-368B/URT, T-368C/URT AND T-368D/URT TO ELIMINATE OSCILLATOR RADIATION AND TO REDUCE FAILURE OF COUPLING CAPACITORS IN THE FINAL AMPLIFIER PLATE CIRCUIT.

MWO 11-5820-258-35/4
MODIFICATION OF RADIO TRANSMITTERS T-368/URT, T-368A/URT, T-368B/URT, T-368C/URT, T-368D/URT AND T-368E/URT TO ACTIVATE THE MICROPHONE ONLY WHEN THE PUSH-TO-TALK BUTTON IS PRESSED DURING AM AND FSK-AM OPERATION.

MWO 11-5820-258-35/5
MODIFICATION OF TRANSMITTERS, RADIO T-368/URT AND T-368E/URT TO REDUCE FAILURE OF COUPLING CAPACITOR IN THE FINAL AMPLIFIER PLATE CIRCUIT AND THE TIME-CONSTANT CAPACITOR IN THE KEYING DIODE CIRCUIT.

MWO 11-5820-258-35/6
MODIFICATION OF TRANSMITTERS, RADIO T-368C/URT TO ELIMINATE OSCILLATOR RADIATION AND TO REDUCE FAILURE OF COUPLING CAPACITOR IN THE FINAL AMPLIFIER PLATE CIRCUIT AND THE TIME-CONSTANT CAPACITOR IN THE KEYING DIODE CIRCUIT.

As I wrote earlier, the Order Number determines whether /3 or /6 applies to the C-model.

Robert,

Ah ha! The MWOs addressed four (4) problems:

1) Oscillator radiation,

2) A particular failure mode in the RF exciter assembly (new one on me that I'll have to look into).

3) Apparently replaced the original three parallel caps coupling the pi to the L section in the PA tank circuit with the single very large ceramic xmitting mica I've seen in some rigs.

4) A time constant problem (component failure?) in the "keying diode circuit." Presumably replaced and/or modified something in the keying circuitry down on the modulator chassis.

Many thanks for the information!

I experimented with my T-368C and R-390A this morning. I was not able to hear the exciter on the receiver in AM mode when I wasn't transmitting, even when I turned on the plate relay switch. I haven't dug inside yet to see if mine has the exciter MWO, but I'm guessing that it must have it?

In case I'm missing something, I tested it with it tuned up on the 75m band, with the receiver tuned near the transmitter frequency (i.e., under normal operating conditions). I tried both with a dummy load and an antenna. I tuned around the nominal Rx frequency to listen for a beat tone, but didn't find one. Gain was maxed, BFO was on, and I tried various bandwidth settings. Didn't hear any hint of the exciter while not transmitting.

Thanks Robert for that info on the MWO's and to Dennis and Mark too for their help. I will check tonight the keying relay on the contact count. Mine is a E model and I'd like to think that mod had already been incorporated in the E. But then maybe when these go through a depot rebuild the modulator and power supply drawers could maybe get swapped around with other different models...maybe ..I dunno.

Thank you
Paul

Could be... My unit looks mis-matched, with the top drawer having a different shade of paint than the rest of the unit, and decals applied to the other two drawers indicating they're now part of a T-368C. Maybe my transmitter has your modulator and power supply drawers? :)

Mark

Could be your mod deck is a later model the than the 'C" indicated on the rf deck nomenclature plate. Or it had the mod done. My 'E' looks to have gone through some depot refurbishing as it has a nice paint job and the lettering was redone. Also on my drawer units is metal stamped on the front panel the s/n to keep it together...but who knows when that was done , probably at this last depot go over. Mine is a Bendix with a contract date I recall being 1959.

Paul

There is an entire group on yahoo groups that is just for T-368s and
BC-610s.

There are folks that want them, and then there are those that swear at them.

The value depends a bunch on what condition it is in, what Tuning Units
and PA Coils that are with it.

Get some info from him and I'll post it on the other list.

# 5460. BC-610 on 500kc?

Yahoo group: T-368_BC-610
Date: 2013-03-01 20:17:57 UTC
From: Roger Basford
Topic: 5460  Message: 5460

Hi All,

Has anyone ever come across a BC-610 being used on or around 500kc? Here in the UK we have a allocation around that neck of the woods and several people on the band use ex-marine rigs, some quite high-powered.

I do have the TU and I think the PA coil for 1-2 Mc, maybe those could be "pulled-down" half a meg? Just thinking out loud really, maybe someone did this back in the day?

73

Roger/G3VKM

Norfolk, England.

# 5461. Re: [T-368_BC-610] BC-610 on 500kc?

Roger,

Way back in time, the U.S. Military did indeed run these around 500 KC.

However, I don't see the 1-2MC PA coil being run there. It is far easier to manipulate a TU to go down in frequency than it is a PA Coil. Look at the difference in a 3MC PA Coil and the 1-2MC one. I haven't even the remotest idea how to determine the number of additional turns that PA Coil would require.

Neither have I seen these available anywhere.

Lots of luck!

Thanks Bob,

I think there's enough literature around for me to be able to calculate the size of a coil needed and I do have 3 or 4 old TUs that I can butcher to make a suitable driver stage. The actual allocation is 472-9 kc, so CW would seem to be the way to go, not really enough room for a AM transmission!

I know of the following web site, http://w1cki.net/Winding_a_BC610_Final_Coil.htm
W1CKI has nice pictures of making his own tank coil for 160m, this might give you some idea's but you would need a lot more inductance.
I have never tired this but had the site bookmarked so if I ever decide to try to put it on 160 I could duplicate his efforts.
Mine currently runs CW just fine but I have not gotten the modulator fully tested just yet, then again with my day job have not devoted much time to it over the past couple months.
I will get it on 3895 before summer....

73,
Dave N8ZFM

# 5464. Re: BC-610 on 500kc?

Yahoo group: T-368_BC-610
Date: 2013-03-02 08:05:08 UTC
From: Roger Basford
Topic: 5460  Message: 5464

Hi Dave,

Thanks for the link. I see that you need a thread cutter to make the wire groove in the former, might be an issue to those with little or no wood-working gear. I have come across a useful dodge for ensuring the spacing of the coil turns. On a Tiger TR-200 ham rig I have (from the late 1950s) the plug-in PA coils are just a smaller version of the BC-610 coils and the maker got the turn spacing right by using what looks like cotton string laid between the copper wire, this ensured equal spacing without the need for a groove. The whole winding was then shellaced in place.

73 and good luck with getting the modulator working.

Roger, et-al,

Sounds to me like hand winding several multi-layer litz wire coils would be required here including a big one for the PA. Also adding a lot of padding capacity. Worth the time and effort?

Probably not, Dennis! I will see what sort of things people are using on the MF allocation, maybe I can find a nice Marconi Oceanspan, which I did my radio training on back in the mid-60s.

Hi Roger. 500kcs in past was an international destress freq. Don't know if it still is or not BUT Ha
Just thinking which is rare for me I don't believe you can pad the old 610 to that freq. May be wrong
but It wold tak some larg vac var. to accomplish it.  Good Luck

I did see a couple BC610s on 3rd world ships that were modified for 410-512 KHZ.
They were a super kluge job with a Pi-L network, bunches of fixed Mica caps, and were tuned by selecting coil taps, on the PA tank. the out put tuning was done with a jumbo coffee can sized
variometer. I would suggest caution if you try this. These and other 3-400 W tx's in that freq range
can develop some hellacious RF voltages. Arcing on the output might be a problem and a potential
fire/ safety hazard in a residential setting.

We have the 500KC allocation over here too.

However, the BC-610 is WAY too much power for our allocation!

I certainly wouldn't want that sort of "mess" in the RF section!

I'd settle for the output of the TS-930SAT for that region. The ATU may well not work due to the programming of the system board, BUT a simple matching device means a LOT safer operation.

You might try getting a ART13 transmitter sice it has a 100kc vfo unit in it and would not require rebuilding to get to 400kcs
not much help am I ?

hello roger and the rest. i use my T1154/R1155 on 500 . it was designed for that and ever since schooldays i have always wanted to use the yellow band legally !
if you want an oceanspan , mike G4EJM has my old one , and has got it going. cheers, alan G4GEN

Hi Alan,

Real radio, a T1154 on 500kc! That I must hear, I suppose you have plenty of space for a big MF antenna though.

I'd love an Oceanspan, Alan, especially one with the dynamotor PSU that I trained on. Three 807s in the final isn't it?

Hi Perry,

MF marine traffic in the UK ceased in 1998/99, I think, (I have a recording of the last night as all the UK coast stations shut down for the last time) and other countries have followed suit. I was a bit out on the new allocation, it's 472-479 kc in the UK, 500kc is designated some sort of heritage allocation.

You're right about the big caps and coils a BC-610 would need. Our allocation is 1 watt erp so often people run quite high power to actually get 1 watt off the antenna, given the inefficiency at those frequencies.

i have +- 50 coils for 1.5<>2Mc the c_454 for sale
NOS in paper but some in bat contion (dried out)
when you see the coils and tu units in the mc509 for 1<>1.5MC then it must be possible to make some coils and tu units for the 500kc
73 PA3HCO

I have come across a useful dodge for ensuring the spacing of the coil turns. On a Tiger TR-200 ham rig I have (from the late 1950s) the plug-in PA coils are just a smaller version of the BC-610 coils and the maker got the turn spacing right by using what looks like cotton string laid between the copper wire, this ensured equal spacing without the need for a groove. The whole winding was then shellaced in place.

Hi Jan,

Good to hear from you again. I too have several spare coils, mostly dried out and only good for parts, so I could reuse one of those but it looks from what others have said that I might need something larger than the standard coil former, possible a conversion to a PI tank.

Anyway, it's started a bit of a discussion on the group, I was beginning to think everyone had sold their BC-610s!

# 5477. T-368 for sale (fwd)

Yahoo group: T-368_BC-610
Date: 2013-03-05 19:37:47 UTC
From: John Poulton
Topic: 5477  Message: 5477

Folks,

This is a posting for another ham, not on the list, who lives near Charthage, NC, John Freeman W7KPB. Also posted this to boatanchors, so please excuse the duplication for many of you.

PLEASE CONTACT JOHN FREEMAN, NOT ME: His email is:

w7kpb@...

John has at least one T-368 for sale. It's "fresh" from a depot, and in fairly nice cosmetic condition, unmodified, as far as I was able to tell from a quick inspection. John's asking $1000 for it, pickup only in Carthage, but he says there will likely be a "door prize" (parts, rolls of coax, bench power supply, or whatever) for the lucky buyer :)

73, John K4OZY

# 5478. Plate Current Meter and High voltage problem

Yahoo group: T-368_BC-610
Date: 2013-03-15 22:55:18 UTC
From: Dangerous Don
Topic: 5478  Message: 5478

I have a T 368 and it's had a few mods done to it over the years and I bought this back in Dec and today was the first time I've tried to get it fired up so to speak. The mods were done by a guy named Ken K8TV and they look very well done. He drew up the plans of the changes he made and my buddy came over today to see how the smoke test went. He is very good at reading schematics where I know very little. Here is the problem I ran into today. My PA Plate meter has 3 wires on the back of it, I took them off to do some cleaning and after a few weeks of them being off I don't remember which wire went where. My friend Doug can follow the schematics and sees just where the main 2 wires go but now where does the third one go on the postive on the meter or the other side.
We are not getting any High Voltage up to the meter it looks like as there is no deflection when we turn on the Plate power switch and the red light doesn't light up. We have Fil Voltage and the Excitation meter is working just nothing on the P A Plate. I have cleaned the inter locks and done all I know what to do and I don't even know were to start testing. If anyone can help Please jump in you can e mail me or call my cell 859-396-2299 ...

Check the hi voltage  fuse. Does the hi voltage contactor activate when the hi v oltage sw is turned on? If the meter wires are reversed the meter will read back wards
if so reverse leads.  BECARFUL  YOU ARE FOOLING WITH 2400 dc.  let me hear of your success, or nrad more bum stears

Stock T-368 has only has two leads connected to the PA current meter.
Modified unit, all bets are off! Disconnect the AC power, close it
up and keep away from it until you get K8TV or somebody else who
really knows what they're doing over to straighten it out. Are you
licensed, BTW? WC4DON doesn't come up on QRZ....

My VC 100 vacuum cap has just imploded for some wierd and unknown reason, we just had a lightening storm and I wonder if I sustained a direct hit but puzzling as everything else is working and no signs of burning, the Beast fires up ok on other bands and tests OK even with the monitor scope looks good. So if anyone has a spare then I would be most grateful, 73, Max (in UK at the moment)

Max,

Isn't the vacuum cap only fitted for the 2.0-2.5Mc range? In other words, do you need it? We are talking about the capacitor that clips into the top of the PA tuning capacitor, not those used in the BC-939?

Like Alan, I do have some spares.

# 5484. WTD: BC-614-E Mains transformer

Yahoo group: T-368_BC-610
Date: 2013-03-18 14:52:15 UTC
From: Roger Basford
Topic: 5484  Message: 5484

Hi All,

I fired up my BC-610 today after winter hibernation and find I have no audio on transmit. After a probe around with the test meter it looks like the 250-0-250 secondary winding of the BC-614-E is down, it's completely open circuit between both windings and centre tap.

Does any one have a junker BC-614 that has the correct transformer (T-103). Alternatively, a transformer with similar windings will do, provided it is roughly similar in size to the original. Primary is 0-115v and secondary windings are 250-0-250, 6.3-0-6.3 at 2 amps and 0-5V at 2 amps. The five volt winding is not essential as I can replace the type 80 rectifier with silicon diodes. I'd guess the 250v rail needs to deliver about 80-100ma? I have a couple of transformers that might do the job, but neither have a 110-115v primary.

Fair price plus airmail postage paid.

Hi Alan,

I have a feeling that the transformers used in the BC-614 have a bituminous potting and wouldn't be easy to un-pot for rewinding, hence expensive. Unless someone comes up with a genuine item from a 614 junker I will probably just use a modern replacement.

Thanks Alan,

I have looked at Hammond and they may have something suitable but I'll hang on for a while. Danbury Electronics did my SX-28 replacement mains transformer but their standard product line is now sold through a UK dealer who puts a heinious amount of postage on shipments. A shame, as they have an ideal replacement for what I need, £30 but plus £12 carriage for something less than a kilo within the UK!

Thanks Alan,

I have looked at Hammond and they may have something suitable but I'll hang on for a while. Danbury Electronics did my SX-28 replacement mains transformer but their standard product line is now sold through a UK dealer who puts a heinious amount of postage on shipments. A shame, as they have an ideal replacement for what I need, £30 but plus £12 carriage for something less than a kilo within the UK!

Hi Joe,

You're right! Unfortunately, it looks like I'll have to bite the bullet and pay the excessive postage, as other UK transformer makers seem to be even more pricey. :-((

Cheers

Roger

Jan,

1) *IF* I could afford to purchase it - THEN

2) I'd have to ship it to the US. - AND [Most importantly!]

3) Do you know what a divorce would cost me?

ROTFLMAO! [Trust me! It is cheaper to KEEP her!]

Bob - I don't think that would work too well. She spent over 18 years married to me while I was in uniform!

She'd recognize ANYTHING that resembled Military *INSTANTLY*!

Besides, with a BC-610 and a T-213 in the shack already, she already knows what things would look like as soon as the door would open! [LOL!]

There just are sometimes that you just can't get away with it.

This is confusing. The add on marktplaats.nl only mentiones one shelter.
No price. The last quote I heard from somebody who inquired on the GAF
add (released earlier) mentioned only one shelter and asking price is
was waaaaaaay over EUR 2750.

Do you know something that's not written in the add?
E-mail me :-) !!

Hi Alan,

Ref the typewriter I mentioned that I'd found in an SK clear-out; it's unfortunately not the type you want but a conventional office type, sorry about that. I did unearth a nice condition Creed 75 teleprinter and that was quickly snapped up on the VMARS-Collector group.

All,

Just had a nice telephone call from Jan, to clear things up.

My e-mail reader had mashed up the two links in Jan's original e-mail
and it showed up as one, hence the confusion.

The first link is for a shelter+generator, price on request.
The second link involves only a shelter, price EUR 2750.

Sorry for the noise I may have introduced :-)

I think the originator meant "PE-95". A PE-94 is the 24 VDC input dynamotor power supply for the SCR-522.

Hello everyone,
I am new to the group and have a great interest in Boatanchor AM Ham radio.
I am trying to find a working T-368 to add to my lineup.
Anyone out there have one they would like to sell?
I would be willing to travel a few hundred miles to pick it up.
Thanks,
Don W9BHI

Philip,

It's difficult but not impossible. The three drawers can be removed easily (4 screws and one or two connectors), and the top two can easily be carried by one person.. even if that person is me, and I'm old and tired :) The bottom drawer... well, that's another story. Two man carry, for sure. It's seriously heavy.

Finally, there's the cabinet. It's very well made, i.e., heavy. I think it should be fairly straightforward for 2 people to grunt it up a set of stairs. Forget the exacty weight, but it's definitely possible for 2 people to move it.

When I bought my first T-3 about 8-9 years ago, I was able to get it out of its then location, on the 2nd story of a house, and down to my truck with help from another elderly gent. Wasn't that much of a hassle.. :)

That help?

Moved a pair of these into and out of basement shacks and across country over the years. Manageable solo with a good hand truck, ramps, etc.. Two strong guys definitely the best way to go, though, and pushing 80 now I definitely go for help. The PS is the heaviest component but the cabinet can be a problem too because of it's bulk.

Worth the trouble, though. Great radio!

All..

Removing the 3 drawers is a must and yes the bottom power supply drawer is a two man operation. I used a appliance hand truck to move the cabinet. The strap on the hand truck holds the cabinet in place. If you're in reasonable shape one can handle the cabinet on the hand truck on level ground. I use a come along tied onto the hand truck to get mine into the back of my truck.

This is the only radio I own that I need to use my floor jack on...when removing the bottom power supply drawer to service.

If you remove the transformer from the power supply deck it lightens it up considerably so that one person can move a T3.

I did the same for my BC610E and my GPT750.

As others have said, remove the drawers, get an appliance hand truck, and borrow a friend.

Or, do it the way I did:

http://www.nf6x.net/2011/12/t-368c-first-smoke-test/

;-)

Good luck in your quest to find a T-368 close to you!

As others have said, the trick to an easy move is at least one other person. While I can say I've removed and moved the heavy power supply deck myself, I'd stop short of saying that I carried it any distance. One of those situations where wanting something badly enough makes you feel young and stupid again.

The cabinet would be the toughest part to move upstairs simply due to its bulk. The three drawers are basically the same hassle with varying degrees of heft.

One word of advice: when moving the drawers, use gloves. There are hand hole cutouts on the side panels that make moving each drawer with its front handles much easier as well as lifting it in and out of the cabinet. But the edge will dig into your hands nicely.

And despite his advanced condition, I'd bet JP/K4OZY could run circles around most guys his age and many younger. I can tell you that his radio building is held in place quite well with some h-e-a-v-y TMC and other gear that didn't just materialize there, along with many other heavy items in his shop. For what it's worth -

I think there's a perverse law of nature that prevents T-368s from being installed on ground-floor, easily accessible locations. Although that's where mine is now, it came from a house at the top of a steep driveway, with a sloping backyard that led around a rough and bumpy yard to a back porch. But two of us and a little wheelie-garden cart managed to move the decks and "mainframe" just fine. I'd still be trying to back the U-Haul up that driveway, but fortunately the seller offered to do the honors.

I think I may still have the picture somewhere of the T-3 being fork-lifted into a 2nd story hamshack!

I have moved two T-368s by myself and it can be done by removing the plate transformer and filter choke from the power supply deck, simple bolt in job. This will really save on back damage. After that the heaviest thing to deal with is the cabinet. The cabinet can be lightened up considerably by removing the back panel and blower assembly. Believe it or not the T-3 can be moved in a fairly small vehicle such as a Volvo station wagon, Subaru Outback etc. although I would avoid going over any potholes with that much weight on the springs.

As others have said, remove the drawers, get an appliance hand truck, and borrow a friend.

Or, do it the way I did:

http://www.nf6x.net/2011/12/t-368c-first-smoke-test/

;-)

Good luck in your quest to find a T-368 close to you!

Yes, all three decks will slide out. The power supply deck is still
heavy, but should not be to hard with a two wheel cart.

This talk reminds me. A friend of mine bought a Collins KW-1 Ser#1 in fact. It was in New York City as I recall on the 13 or so floor.

When I bought my T-3 a few years back, I was able to just back my trailer to my shack door and just roll it in. My shack is in the basement with a walk out door to the yard, very easy for me.

# 5518. T-368 Weights

Yahoo group: T-368_BC-610
Date: 2013-04-20 12:32:32 UTC
From: Steve Hobensack
Topic: 5518  Message: 5518

The approximate weights of the units:
RF Deck 90 Lbs
Mod Deck 175 Lbs
Power Supply Deck without Transf/choke 150 Lbs
Removed Trans/choke 150 Lbs
Cabnet 150 lbs

My Xyl and I moved these down a circular staircase with a hand truck.
The most difficult unit was the cabnet due to size. We punched a corner
into the drywall.

> Not a big problem when the transmitter is mounted on casters. I roll #89 around easily thanks to the base I made for it years ago. Of course, trying to get it up onto the base by myself resulted in getting pinned against the wall for about half an hour until someone found me. Still amazed I survived the 'young and dumb' years.

When I found it in 1988, a buddy & I took his pickup to get it. It had been left laying on its side in the grass next to the antique shop that sold it. We had nothing with us to deal with a 6 foot transmitter (long story), so we simply backed his truck up to it, removed the tailgate, slid out a piece of 3/4 inch plywood he had in the bed and laid it from the bed to the ground. We then stood the transmitter up, laid it back onto the plywood, grabbed the plywood on each side and lifted/slid it into the bed. He was in his 50s at the time and I was in my late 20s. Not sure I could do it today, but he probably could even at 78. It only weighs 675 pounds.

Don,

Six, basic through E.

There was a TM 11-5820-258-35P but I have never come across one.

Yes (actually Change 1 covers the D and Change 2 covers the E) and I have a reprint of it available. But it does not include a parts list, which was the original question.

I picked up my T-368F made by TRW today.
No mods, but very clean.
Non functional at the moment.
It has some issues with the HV supply I have to figure out.
Anybody know what the switch (S15) is for on the top right rear
of the RF deck?
The manuals I have only go up to the E revision.
Thanks,
Don W9BHI

Gives you the option of having the PTO run continuously or only when the transmitter is keyed. In earlier models the PTOs ran continuously (no switch). Barely or not discernible in nearby receivers in some installations and transmitters but could be a problem in other setups. I can just barely near the PTO in my Basic model for ex. Don't know exactly when the switches were added. Have heard of other Fs that had them. Don't know about the E. I also had a C model that had what appeared to be a field mod which keyed the PTO only on transmit (no switch).

I posted the answer to the "when" question earlier this year.

OEM change (addition of the switch) was at T-368E/URT. MWO
11-5820-258-35/3 dtd 09/22/65 applies to Basic through D.

Don,

Six, basic through E.

There was a TM 11-5820-258-35P but I have never come across one.

From: w9bhi
Topic: 5536  Message: 5536

I just picked up nice unmodified T-368F by TRW over the weekend.
Getting it cleaned up now and will have to troublehoot it because it trips the front panel plate circuit breaker when it is put into the operate mode. (it is ok when in the tune mode).
I need to check all of the tubes also.
I have figured out how to make the proper connections and jumpers to the power supply chassis connector to run it on the bench by itself.
I do know one thing though, the choke has bad seals on the terminals and is leaking.
One is split and coming apart.
There was a nice oil slick on the bottom of the cabinet.
The filter caps in the mod deck just above the choke had oil drips hanging from them that got on the top of the power supply deck.
All other tranformers and caps are dry.
Using Brakleen and a rag (wearing gloves of course)I got the power supply deck clean.
I Gunked the bottom of the cabinet and it came out clean and dry.
I need to find the correct power inlet plug, the previous owner just soldered the power cord onto the terminals.
That's all for now, I will keep you all posted on my progress and no doubt will be asking for your expertise.
Thanks,
Don W9BHI

Well Congrats of finding your T3 .. I picked one up in Dec and I've yet to put it on the air. Mine had some mods done to it by 2 fellows who are on this chat page so I can trace the history back for close to 20 years on my rig. I have the B & W T 368C model and this past weekend I just got my R 380 A back from alinement and it's working 100 percent.. so now it's time to fire up the T3... we tried to get it fired up about 2 months ago but there seems to be a problem with the HV as there is no plate voltage on them meter. and I need to rewire my mic for PTT and I hope to have it on the air chatting with other T3 owners.

Got the PS deck working on the bench today.
Both 3B28 were arcing internally.
Replaced the tubes and all is FB.
If anybody is interested, I can post a list of what needs to be jumpered and connected to run the PS deck on it's own.

Thanks,
Don W9BHI

From: w9bhi
Topic: 5536  Message: 5542

To operate the T-368 PS on the bench:

First you MUST disable the mechanical crowbar on the HV output terminal, I used a Tywrap to hold it open.

Also S-11 on the rear of the chassis must be jumpered.

Connect 120 vac to the two top terminals of the front panel filament circuit breaker.
Connect the third wire ground of the ac power cord to the chassis.
(my unit had quite a bit of leakage current on the chassis.)

Jumper the following pins with clip leads on chassis connector J7:
17 to 13
14 to 12
19 to 4
16 to 8
5 to 1 (to keep the over current relay from tripping)

Operating the plate switch will turn on the HV.

This should make troubleshooting a PS much easier.

Please be careful there will be about 3850 volts @.5 Amps at the output terminal when operating.

With all due respect benching the T-368 PS to check out the 3B28s (or solid state replacements) is doing things the hard way....

I bought the the T-368 knowing it was blowing the plate breaker.
There could have been a number of things wrong.
The very first thing I did was to test the 3B28's on my Hickok tester and they showed to be "good" with no shorts.
I then did some ohmmeter readings on the HV circuitry on all 3 decks and all was OK.
Being that you cannot see what is going on with the PS deck when it is inside the housing, I thought it would be easier to observe/take measurements with it on the bench.

Don, et-al,

Well,glad you found the problem in your T-368. It's a great rig, enjoy! For future reference the first line of maintenance for breakers kicking out as you describe would be to swap out the rectifiers (tube or solid state). To observe the 3B28s at the moment of turn-on and in operation, taking the back off the rig is considerably easier and safer than benching the PS and also affords one the opportunity to watch for possible arc-overs in the DC lines up to the modulator and PA decks. Also, tube checkers like your Hickok don't/can't apply anything close to the operating voltages of a 3B28 or even the 5R4s used elsewhere in the T-368. This radio can kill you (ditto the BC-610). Not a good "starter" rig on which to learn electronics and I get very concerned by some of the related traffic I see here and elsewhere on the web.

It is definitly not a starter rig or for the electronically challenged, always have one hand in your pocket etc.
Changed out the N and the C connectors for SO-239's.
Waiting for the power connector from Fair radio.
Hoping to get this thing on the air by this weekend if no smoke escapes from it the first time trying to load it into a dummy load.

I'd say that the BC-610 is a good bit harder to get bit with.

With all the interlocks in place, you have to go pretty far out of your way to get into HV.

Additionally, the "modules" aren't in drawers. There is some healthy 1/4 x 20 bolts in each corner. Then the entire terminal strip is up front, and not readily disconnected. While not "quite" idiot proof, they are close.

Now if you jumper out the interlock on the PA coil cover, and decide to move a swinging coil while tuning the final - I'd have to say that you worked at it, and can't possibly have had one hand in your pocket!

Don,

Have owned a couple of these over the years and worked on several others. My "C" model had the original N and C connectors. I had the mating cable ends so didn't bother to change them out. The "Basic" (first model) I'm using now came with an SO-239 and a BNC already installed. The things were built for 24/7 use and we barely warm them up in ham use. Only real "problem" I (and others) have encountered is with the relay ahead of the high voltage transformer. The sealed unit used in the later models is underrated and will fail after a period of normal ham use. I believe this is because we operate primarily in the PTT mode where the military mainly used these transmitters for RTTY, especially in later years. The open-frame relay used in earlier models lasts longer but the contacts will burn and will start to stick in the closed position after a few years of regular (ham) use. Dressing the contacts helps for a while but the only permanent fix myself and others have found is to replace with a mercury plunger type.

Good luck!

Don, et-al,

Well,glad you found the problem in your T-368.  It's a great rig,
enjoy! For future reference the first line of maintenance for breakers
kicking out as you describe would be to swap out the rectifiers (tube
or solid state).  To observe the 3B28s at the moment of turn-on and in
operation, taking the back off the rig is considerably easier and
safer than benching the PS and also affords one the opportunity to
watch for possible arc-overs in the DC lines up to the modulator and
PA decks.  Also, tube checkers like your Hickok don't/can't apply
anything close to the operating voltages of a 3B28 or even the 5R4s
used elsewhere in the T-368.  This radio can kill you (ditto the
BC-610).  Not a good "starter" rig on which to learn electronics and I
get very concerned by some of the related traffic I see here and
elsewhere on the web.

I have the original sealed plate relay.
It had welded contacts(probably from the failing 3B28's)
The previous owner opened it up to see the carnage.
It now has a large motor contactor mounted on top of the chassis.
I will be replacing it with an Crydom A1240, 120 volt 40 amp SS relay with AC control mounted on the bottom of the chassis with a little heat sink compound.
I have used a similar unit(Crydom A2440, 240 volt 40 amp AC control) before on the Drake L4B and SB-220 to switch the primaries of the plate transformers with very good results.
I hope to be up and running soon!

From: KA4KOE
Topic: 5554  Message: 5554

I am seriously considering acquiring a T-368. However, my earlier posts state that my shack is located in an upstairs bonus room over our garage. The floor joists are 2 x 6's spaced per code. I an jest a humble 'lecktickle injuneer, so I'z noze nuttin' 'bout boards 'n joists.

Question:

If one installs a T-368 on 4 casters, any idea if this monster will crunch thru the floor and plummet smack dab on top of Sheri's (K4SMN) Porsche Carrera?

If that happens, then the least of my worries will be the damage. Sheri is a country girl brought up in South Central Georgia who knows how to handle a firearm with deadly accuracy.

Get my drift?

tnx

Philip

Think you're OK here. If worse comes to worse the Porsche should
provide more than sufficient cushion to preserve the radio. :^)

Not gonna work. The footprint for the transmitter is 6.9 square feet. At 650 pounds, that works out to 95 pounds/SF. An Architect here tells me not to load up an upper bonus room floor to over 40 lbs/SF, with 2 x 12 joists spaced per code.

Moot point.

You might lay down a sheet of 3/4" plywood and set the T-368 down in
the middle of it. Would spread the load out enough to be safe.

I think a lot would depend on the size of the rooms floor span and that the placement of the 368 would be as close to the wall as possible and on the side where the floor joists are coming out. Also if you can mount the bottom of the 368 flat onto a hefty piece of plywood that will sit flat on the floor that'll help distribute the weight rather than at 4 casters. I had heard of someone who did this with a BC 610 , only 400 pounds, and used those furniture pads that are real thin under the plywood to move it around on the floor.

Also , to be safe ...park the Porsche somewhere else...problem solved :)

There isn't a lot of data presented here, such as spacing of the joists, i.e., 16 or 24 inch centers, nor do I see the length (or span) of the joists. Nor do I see what the sub-floor and floor thicknesses are. Of the construction that I have done and that that I have observed, without calculations, I would certainly feel safe placing my T-368 on casters in a second-floor environment of a code-built home. Would you feel safe with three 220 pound humans standing in that floor footprint. I would. Think about it. I would take care to purchase good quality and weight rated casters, however.

Gotta say, 'new' construction really blows. 2x4s are now more like 1.25x3s, if that. I'm in a late 80s-built place here since 2008, adding shelves to the walls for some of my radio equipment caused the floor to sag enough that the door now won't close.

Previous place I lived in was a mid-late 1800s Victorian built considerably better. Had a radio room full of boatanchor gear including 4 large (300-675 lbs) transmitters and a rack full of receivers, Steelcase tables, etc and other gear, and a 7 foot, 1400 lbs broadcast transmitter in the formal dining room along with a T-368. SX-28A on a large marble shelf & BC-610 in the front foyer. Two rooms upstairs loaded with everything from old wooden radios and slate-based knife switches to several ART-13s and other milsurplus gear. Zero issues.

If all else fails, go for ground floor/basement or add some sort of additional support.

Does the architect know the recommended maximum loading for a manufactured home built around 2008? I have my T-368C on casters in my manufactured home, which is permanently mounted on a brick foundation, with steel jacks in the crawlspace. It's next to an exterior wall (and thus, near the foundation). Is this a potential problem even before I move more green radios into the room?

Not gonna work. The footprint for the transmitter is 6.9 square feet. At 650 pounds, that works out to 95 pounds/SF. An Architect here tells me not to load up an upper bonus room floor to over 40 lbs/SF, with 2 x 12 joists spaced per code.

I'm not an architect nor do I try to play one, but I believe there are separate considerations for "live load" (things that stay in motion) and "dead load" (massive objects which stay in place). None of us, whether we're 150 or 350, stay in the same spot, so the strain of our load is not focused on one location. The former basically test short term strength and rigidity/ bounce, and the latter test long term sag and ultimate fail strength. Putting a massive object in a fixed location is a very different challenge from "ordinary living" but I bet a T-3 isn't that much more challenging than a serious piano...

Span and spacing make a big difference. I agree with Todd that from what I have seen, modern "code" doesn't lead to very robust construction, so I'd proceed with caution (but could you reinforce from below with some steel beams/ columns?

Good luck and 73

From: w9bhi
Topic: 5536  Message: 5565

I got the new SS plate relay installed and put the decks into the cabinet.
No more "kerchunk"
I loaded up the rig into a 1kw load and saw in excess of 600 watts.
Tried to key it up from the mic plug in AM but the keyer circuit is not working.
The transmitter grid block line worked but the antenna relay didn't.
It cooked the 47 ohm 2 watt resistor in the antenna relay cicuit.
The 6AL5 and 6AH6 test good on my Hickok.
I have the mod deck on the bench now and I am going to try and power it up by itself and see what is wrong with the keyer.

Don,

Check to see if the 6AL5 and 6AH6 are lighting up. They get their filament power from the speech amp chassis mounted on the left rear of the modulator drawer. Reseating the speech amp connector solved the "not keying" problem for me a couple of times on a "C" model I had. The old Basic I'm now using doesn't use any tubes in the keying circuit BTW.

Dennis,
I got the mod deck powered up on the bench.
The 6AH6 was bad.
My Hickok said it was good.
I swapped it with one from the RF deck and the keyer worked.
I guess tube testers lie sometimes.
I ordered 2 tubes (they were only $3.00 each) from Hamtubes.com.
The unit is back together and I am in the process of wiring up a powered D-104 microphone to the mic connector.
Have to do the waiting game now.

From: Mark J. Blair
Topic: 5568  Message: 5571

I had to replace the excitation and filament voltage meters in my T-368C. I couldn't find exact original meters, but I found similar enough ones to make the swap.

The voltage meter was easy, but the excitation meter took a little bit more work. The divider circuits that set the ranges of the excitation meter assume that the meter winding has a particular DC resistance. It was only modestly difficult to find a meter which looked right and had a suitable full-scale range, but the coil resistance was different. I replaced the precision divider resistors for the different ranges with trimpots and then adjusted them for correct meter reading in the various ranges.

Hello John,
The meter is 15 Ma full scale.
It says 3.3ohm impedance and "ruggedized" on the bottom of the scale
plate.
It was made by Phasotron.

If you have one like this,it would be great.
Thanks,
Don W9BHI

# 5580. BC-614 power supply protection

Yahoo group: T-368_BC-610
Date: 2013-05-20 07:06:35 UTC
From: Roger Basford
Topic: 5580  Message: 5580

Hi All,

Some weeks ago I had a failure of the 250-0-250V secondary winding of the T103 power transformer in my Detrola BC-614-E. A search for an exact replacement was fruitless and so I reluctantly forked-out 42 GBP for a Danbury Electronics substitute. Along the way, I was offered several other transformers but they all lacked the 115-120V primary I needed, UK mains supply being 230V, nominally. However, the replacement appears to be doing the job and I chose a method of mounting that used the original through-chassis aperture without need for further drilling.

Looking at the BC-614 manual, it shows that 20ma of B+ current is drawn in operation. I metered this on my new transformer, at the 0 volt centre-tap and found it was indeed 20-23ma, with a small surge at power-up to about 50ma as the rectifier warmed up and the smoothing caps charged. This suggests to me that the original winding didn't burn out due to faulty smoothing caps, rather it probably failed through age and poor insulation. Anyway, whilst I was "in the area" I fitted a 100ma fuse in the centre tap of the new B+ winding, which should provide some protection if I have a component somewhere that is occasionally dragging the B+ down. The B+ line is always energised when the BC-610 power is on, so the load on the transformer is constant.

My BC-614-E has already got a non-standard AF output transformer fitted and has largely been re-capped, so I wasn't too worried about compromising "originality".

# 5582. Buzzing BC-610 PA Relay

Yahoo group: T-368_BC-610
Date: 2013-05-20 07:25:32 UTC
From: Roger Basford
Topic: 5582  Message: 5582

Hi All,

Since I got my BC-610-E, it has always suffered from a noisy RY4 relay, the relay that shorts the output link on the PA tuning coil when on receive. The noise is a loud buzz at mains frequency and I am wondering if other owners have a similar problem, or do I have a duff relay? The noise level varies each time I go to transmit; sometimes the buzz is acceptable but usually it is really loud - but will usually quieten down if I go to receive and back to transmit again.

As I'm in the UK the mains supply is 50Hz, not 60Hz, is this likely to be a factor? If so, the other 115V relays in the transmitter seem happy enough on a 50Hz diet. I use a "site-transformer" to give me 110V AC from 230V in to power all my American gear. This type of transformer is for use outdoors with power tools and has a centre-tap to ground, so that the maximum a person could be exposed to is 55V above ground in a fault situation. For my purposes, I simply lift the centre-tap so that the transformer is a straight 230/110V type, I don't trust auto-transformers that have a single tapped winding.

Just lately, RY4 has failed to operate on occasion, leaving a dead short across the link and causing the PA coil some grief and smoke, so I feel that my RY4 is on the way out. Any comments?

73

Roger/G3VKM - Norfolk, England.

Roger,

Suggest removing RY4 completely. In the SCR-399/499 setups,
apparently, the transmitter PA tank circuit and xmitting antenna
together could adversely affect the receivers in some circumstances
and RY4 shorting out the link would alleviate this. Suggest removing
RY4 and testing to see if doing so has any adverse affect on your
receiving setup.

# 5588. Re: Buzzing BC-610 PA Relay

Yahoo group: T-368_BC-610
Date: 2013-05-21 06:02:31 UTC
From: Roger Basford
Topic: 5582  Message: 5588

Hi Dennis & Alan,

Thanks for the advice. I also read somewhere that the PA stage can radiate noise if the link winding was left open, hence the need for RY4. A test using an insulating bar like Alan suggests would show whether noise is an issue here. I use a Wellbrook one-metre loop active RX antenna fed through a ex-USN multi-coupler to my different RXs, so the RXs and the BC-610 don't share a common feed or antenna changeover system. I'll let the group know what I find.

# 5589. Re: fuse

Yahoo group: T-368_BC-610
Date: 2013-05-21 06:07:46 UTC
From: Roger Basford
Topic: 5581  Message: 5589

Hi Alan,

I had a look at the faulty T103 that I removed from the BC-614 and it does show signs of the filler starting to sweat out, so I think it must have been overheating for a while. Anyway, hopefully the fuse will trip if any other components start dragging the HT down. I thought the fuse was a worthwhile "mod", given the price of a replacement transformer.

# 5590. relay

Yahoo group: T-368_BC-610
Date: 2013-05-21 07:40:39 UTC
From: Alan Morriss
Topic: 4730  Message: 5590

hello roger, the SCR399 was designed for separate whip antennas for each rx and a bigger one for the tx. as such it works very well. the relay was designed with this in mind. i expect the noise was generated by the PE95 and radiated via the tank coil. i tried using a johnson kilowatt matchbox with a feed for the rx antenna using a doublet. it worked ok . the trouble was that it cluttered up the shelter , so it is now on the shelf and i use the BC939 and a long wire. results seem the same. i also use a plant transformer when the truck is in the tank shed . i had to disconnect the centre tap on it as the truck was live to ground and i have to ground it to the steel stucture of the building .
i never could detect any noise from the BC610 in the receivers whether the relay was operational or not.. i leave it blanked off . i used the feed to the relay to operate the antenna change over in the matchbox. alan G4GEN

# 5591. RY-4 Relay

Yahoo group: T-368_BC-610
Date: 2013-05-22 06:14:49 UTC
From: Roger Basford
Topic: 4730  Message: 5591

Hi Alan,

No, I don't think it was the PE-95, more like there is an issue with thermionic noise generated by the PA valve or perhaps a de-sensing of the receiver caused by the link, either way the short was thought to be necessary. I may have a suitable heavy-duty DC-coiled relay which can replace the old RY4 and it will be a simple matter to energise the new one from the RY4 115V supply terminals on the modulation deck, via a suitable step-down transformer and a couple of diodes.

I've had to divert my attentions to the Larkspur C11 TX over the past few days; the HV flashed-over in the 12-way power connector and I had to replace the whole socket, made me realise how bad my eyesight is getting! Anyway, it's done now and can get back to the BC-610.

Hello Dennis,
I need 2 of those clear, square, blown fuse indicator lamps for my T-368.
Do you still have any left?
Thanks,
Don W9BHI

I would be interested in one of the bulbs if I could buy one from you Dennis. Just let me know what you need for one plus shipping and I'll get it right off to you ...

Don,

Am getting more requests for these than I have stock. Do you need a replacement for both indicators or only one of the pair in your radio? I would like to spread what I have around to as many needy T-368s out there as possible. :^)

Dennis,
The left indicator is burned out and the right one has the lens broken off, so I will need 2 of them.
Let me know how you want me to pay for them.
Thanks,
Don W9BHI

Ah! My wife, who is more Internet-savvy than I am (and a George Clooney fan!), tells me it's called "The Monuments Men" and is written by Clooney too. Sounds a vaguely Indiana Jones type plot :-)).

See http://www.imdb.com/title/tt2177771/

I shall make a point of seeing it when it comes out.

Hi Alan,

OK, well the plot synopsis sounds good and I think is based on real events. I know the Allies had teams like TICO who went after German inventions and research projects so it makes sense they would have wanted to track down looted art works too and had special teams for that purpose.

Hope to see the 399 when the film comes out, then I can bore people by saying "I've sat in the back of that truck!".

Don,

You might keep an eye on eBay, I just picked up an original T-368 PA plate current meter there. (The guy didn't have any other T-368 stuff, I checked.) Worse comes to worse guess you could use a non-original 0 - 15ma unit but you would probably have to come up with new shunts to make the readings all come up correctly. Dooable but a job..... :^(

Did the lights get there OK?

# 5608. T-368 Tuning Chart Pocket Wanted

Yahoo group: T-368_BC-610
Date: 2013-06-08 00:01:39 UTC
From: Mark J. Blair
Topic: 5608  Message: 5608

My T-368C is missing the sheet metal pocket that mounts on the side of the cabinet to hold the tuning chart. I've just purchased a tuning chart on eBay, and I'm wondering whether any of y'all have an extra pocket to put it in? If all else fails, I suppose I can fabricate one for it one of these days.

As long as I'm asking questions which are likely to leave me unsatisfied, I suppose I should also ask whether there's a spare T-shaped Allen wrench out there that fits in the holding clips in one of the handle cutouts. I tried ordering a T-shaped wrench from McMaster-Carr that was bent in the same manner as the wrench pictured in the TMs, but it sadly turned out to have a handle that's much too large to fit in the storage location. Maybe I'll need to cut and weld it one of these days to make it fit?

Don,
Have you disconnected it and checked to see if the winding is good with an ohmmeter? Sometimes difficult to do with an ammeter as some will have an internal shunt resistor. If winding is good it may be fixable. Is the meter openable? Actually all meters can be opened even hermetically sealed ones with varying degrees of difficulty :) . I successfully opened one using a pipe cutter some years back and used some strong metal tape to reassemble the case.

Good luck,
Ken S

The faulty excitation meter in my T-368c didn't have an internal shunt resistor, and I was able to open it nondestructively. However, I judged that it had bearing problems beyond my skill to repair, so I found a similar-looking 15mA meter on eBay and modified the external shunts to compensate for the different coil resistance. That wasn't quite as hard as it might sound, since I included trimpots rather than trying to construct oddball shunt resistor values. I left the original shunt resistors in place but out of the circuit in case I ever get my hands on an exact replacement meter, or find some way to repair the original meter.

I also had to replace the filament voltage meter, but that was much easier since it is a simple single-range AC voltmeter with no dependence upon its precise coil resistance.

I opened up the meter and inspected it under a magnifier light.
I found what looked to be a metal splinter stuck to the magnet next to the moving coil.
I used a sewing needle to remove it.
After a minor adjustment to the front bearing, the meter is now fixed!
Thanks to all who replied with possible solutions to my dilemma.

From: w9bhi
Topic: 5612  Message: 5612

I swapped out the 4-125 modulator tubes with known good ones.
I found out one was very weak, maybe that's why I couldn't get more than
180 Ma. of swing on the modulator plate current meter.
I managed to find a NOS tube and now I can get an easy 250 ma.
Scope shows 100% mod no sweat.
Great signal and audio reports.
I'm very happy with "the beast".

# 5614. FS: T-368's and Westinghouse MW-2

Yahoo group: T-368_BC-610
Date: 2013-06-18 22:49:45 UTC
From: john poulton
Topic: 5614  Message: 5614

Please forgive the duplicate posts (this went to "boatanchors" as well). Note that these are indeed
the last two T-368's from John Freeman's stash.. Thought it might be worth reposting to this list, since.. hey,
it's T-3's!

I have come into a large stash of interesting boatanchors, many of which need to find good new homes.

1. A Crosley T-368-C/URT transmitter, S/N 81. This rig is in nice shape, appears to have all of its tubes and other
parts, and is quite nice cosmetically. It also has the highly desirable cradle/dolly, a massive cast aluminum
item with heavy-duty casters. You can see pix of this rig, including a peek inside 2 of the drawers at:

http://www.jptronics.org/pix/t-368s/

Just run through the "crosley" pix. Asking $1200 for this rig. Previous owner says it came to him from
a depot, so it *should* be in good shape, but I have no idea what you might have to do to make it operational.
Assume you'll have to work on it.. always a safe assumption. Pickup near the Moore County Airport in
central North Carolina.

2. A Bendix T-368-E/URT, S/N 286 (I think). This rig is slightly less nice than the Crosley, but entirely
acceptable. It'll need a bit more cleaning, and at least one knob replaced. It has no dolly/cradle. I also
can't presently get into its drawers easily, so no internal photos yet. Pix at the same URL as for the Crosley,
but run through the "bendix" photos. More info on this one soon. Asking $1000, pickup same place as
Crosley. More info/pix on request.

These are about as nice T-368's as you're ever going to see in the 'wild', so take advantage!

3. A pair of Westinghouse MW-2 PA units (note, this is JUST the PA, no power supply, no modulator. I have yet
to take detailed photos of these things, but you can get some idea by perusing the photos at Nick England's
website:

http://www.virhistory.com/ham/freeman-01.htm

It's the 3rd row of photos. I suspect these units are missing some stuff, but I do have the PA tubes for them,
and they're loaded with interesting parts (vac variables, roller inductors, sockets, tubes, etc, etc).
Asking $200 for the pair, pickup in Chapel Hill, NC. They roll, and I'll help you load, of course.

The TBK you'll see in the same photos isn't available yet.. though if you're interested, feel free to get in
touch about it! Some of the WRA-3's may be negotiable as well.

73, John K4OZY

I have a couple of buddies who are going to come over and work with me on this project. I bought a B&W T368C and when I plugged it in every thing came alive except the HV meter wasn't reading any thing. I've read several items where the interlock need to be cleaned and that might be the problem. Ok I thought I cleaned them good and that's why my buddies are coming over to help me out but neither one of them have had a T3 and I was wondering if I could get a few ideas from some of you guys as to what they might look for first. They have lots of experience in HV and they might well know to look for but I was hoping to give them a head start to what to check first .. I know this is a broad question to ask with so little given to you to start with but my fingers are crossed. I've been waiting for almost 7 months to get this on the air and I'm ready now the R390A is ready and so am I .. Thank you for any help that you can offer in advance ..

OK, this one has come around before (March 15, 2013, check the archives). Modified radio, new owner who has no experience with the T-368, who by his own admission knows "very little" about reading schematics and who removed existing wiring from the plate meter and then forgot how to put it back in place. Anybody on the list near his QTH (see QRZ.com) who can go over and get the thing squared away before Don kills himself?

Get a manual, read it.

Read the "files" section of this list.

Clean all of the decks while looking for problems and burn marks.

Especially read the section on Interlocks, check each wire carefully.

Check the HV wiring on the power supply deck carefully for cracks.

Ask more questions,

Joe

Hi Mark,

They do turn up occasionally on eBay, I bought my plate there along with a few circuit breakers and relays in a job lot. I have a BC-601-E model but it had been incorrectly labelled as a -D, I still have the -D plate somewhere. Another possible source; I have seen European eBay seller(s) offering replica plates for various radios and I think other military hardware, might be worth a search in the Militaria section and then ask if they'll make you a one-off?

# 5620. Re: T368

Yahoo group: T-368_BC-610
Date: 2013-06-26 15:02:20 UTC
From: w9bhi
Topic: 1103  Message: 5620

Check to make sure the safety interconnects on the rear of the decks are clean and that the decks are completely seated in the cabinet.
Check the 3B28's to see if you have an open filament.
There is a time delay tube on the power supply deck that enables the plate relay after about 45 seconds.
If it is not functioning there will be no HV.
Also you may have a fried plate relay, these things take a beating.
I have had my power supply deck on the bench for troubleshooting puposes.
Look in the files section of this site for information on how to hook it up if you want to go that route.
BE REAL CAREFULL not to touch anything while the deck is powered.
If the plate supply comes on, there will be about 3800 volts at 500Ma
on the HV output terminal.
Saftey is the most important step here!
Keep us posted on your results.

What high voltage Meter? Meaning an external meter??

Common failure points are the ceramic insulators use on the back of each deck to make HV contact. Clean them very inside and out. I;m in process of also replacing the high voltage wiring between and in each deck as some of the wires show circular cracking.. Also check the relay on the modulator deck as it shorts the mod transformer when in CW mode.. Make sure relays are lining up and clean.

This transmitter drawer appeared on eBay:

http://www.ebay.com/itm/130937467332

Do any of y'all recognize it? General construction is very similar to a T-368 drawer. It looks like an HF PA, requiring an external power supply and exciter.

Absolutely do not recognize it at all.

It does have the appearance of a Military RF Deck. It uses one BIG finned Power Tube!

It "may" be a Harris PA. [?]

It's an RF deck from a T-946, an SSB conversion of a T-368, Google it.

From: ab3ht
Topic: 5628  Message: 5628

Hottest day of the year (so far) found me on the Garden State Parkway with a new-to-me t3 in the back of the pickup. Almost 3 hours later I'm home, hot, and happy. (though not happy about being hot, truck should have been ordered with A/C)
Unit is in OK shape, needs a few items, but it is nice.

I'd like to enlist some help, these are the items I can see missing.

1) C9, (the bigger of the two vac caps).

2) J8 (the chassis socket that accepts p101, the 15 pin amphenol plug from the exciter) If any one has a parts chassis, could you leave about 2-3 inches of wire on the j8 socket? (it would be easier to match the all the wires by color and tracer). Somebody needed this socket, probably to use the exciter in some other rig.

3) T10,I don't know what this transformer does, it is not listed on the schematic I have. But there is a hole in the chassis with "T10" next to it, and a few loose wires under the hole.

4) A schematic for the "B" variant, the book I have is for the base model.
Many thanks, Ed, AB3HT

Well with almost 7 months passing by, my T368C in alive and well. I got some help from some good friend who didn't want to see me fry myself so they came over and jumped in and help me get my rig running right. All of this could of been helped if someone who sold me the transmitter told me to put a plug in the back with a jumper in it. And I learned a lesson don't ever take wires off a meter if you can't remember how they go back. I'll be taking pictures of all future events before it happens any more. I could of saved myself a lot of trouble if I just would of remembered a few things. But all is good and I'm still alive and soon to be on the air, as soon as I figure out about a few more things I have to look up and see how they work along with the T3,R390A,Me 165/G and the TN 339... thank you to all who sent in ideas when I didn't have a clue as to what was wrong.. some times the simple things just knock you out.

Don,

Congrats, and you're not the first guy to be flummoxed by that jumper socket on the back of the radio. The ME-165 is a very neat little box, you can use it with your other rigs too. Ditch the TN-339, though, only good for loading up whips or short wire antennas. The T-368 works FB into your usual 50 - 75 ohm loads all by itself.

I'll second the comment by Robert Downs!

Don't pitch the TN-339!

It is the brother to the BC-939 that is used with the BC-610.

Both were *mainly* used for short whip antennas.

What the TMs call "long wires" definitely are not.

However, you can run a single piece of wire to the length specified in the manual. The advantage? It makes it a whole lot easier to get on 160 using it. It uses a lot shorter wire.

Not everyone has the space to string a dipole for 160. The property I'm on is a pain to even put up an 80 meter dipole.

Disregard the name "Antenna Tuner". It isn't one. It is a coupler, just like the BC-939. It takes 50 ohm input, and couples to the shorter lengths at a MUCH lower impedance. WB2FCN has measured the output impedance at about 300 ohms.

# 5634. WTB - BC-610

Yahoo group: T-368_BC-610
Date: 2013-07-29 18:48:01 UTC
From: pharr.dennis
Topic: 5634  Message: 5634

Want To Buy BC-610 hopefully within 500 miles of Oklahoma City, OK. I'm looking for an E model, but would consider any other model. I would prefer a complete unit, but would look at any unit as long as the major components are included. I wouldn't mind if the tubes, tuning units and/or the coils are missing. Also, wouldn't mind cleaning and/or repainting if needed.

Unfortunately, my budget doesn't allow for shipping a unit long distances, but I can pick up the unit if I can find one within 500 miles - basically Oklahoma, Arkansas, Texas, New Mexico, Kansas & etc.

I am already aware of the available units currently for sale, but none of them are physically close enough to make the purchase and shipping cost affordable for my budget. If anyone is aware of a unit for sale in this area of the country, I would appreciate a heads-up.

# 5637. BC-610 for sale in Greensboro, NC

Yahoo group: T-368_BC-610
Date: 2013-07-30 02:31:39 UTC
From: Tom Bridgers
Topic: 5634  Message: 5637

Hi Dennis,
I have a BC-610 that I'd like to sell. However I am
located in Greensboro, NC. Would you consider
one that far away? I'd be willing to make you a
very good deal.
Best,
-Tom KE4RHH

Hi Dick,

I'll get together some photo's of it, along with the answers to your questions.

I bought it from JP Poulton in Chapel Hill, who is very active in BA type equipment. I had great plans to get it running, but I've been hit with a variety of challenges. The latest of which is my wife had major surgery and she'll be getting physical and occupational rehad for quite a while. Net, net of that is she needs help from me 24/7. Not much time to get the BC-610 going.

A quick summary. It's a Bogen, and IIRC it is a model I. I have all the tubes, all standard oscillator modules, and RF coils for 80 through 20. It comes with a manual.

Previous owner pulled the two HV caps, and I have replacement caps that will need to be installed. Therefore I have not had the BC-610 on the air, but I was assured by JP that it would work just fine when the caps were installed.

Price? I'd like to get $550.

I also have the separate audio deck, which is an additional $150.

Also have the antenna tuner, which is an additional $ 125. However you don't really need it to get the rig on the air -- assuming you're feeding it into a 50 ohm load.

If you'd like to stop by Greensboro and take a look at it, I'd be pleased to show it to you. I'm retired I'm very flexible on times, etc.

If you stop by, I also have a lot of R-390A's that need a new home. I'd also be willing to negotiate on one or more of those.

Best,

-Tom KE4RHH

"Plate" type SPDT relay, 9000 ohm coil in the A model, 10K in B & C.
Plenty of room under that chassis so a broad range of replacement
relays of the correct (or close) coil resistance would work. Part of
a circuit that protects the 6000 RF driver tube in case of excitation
failure.

Ed,

On second thought, which T-368 model do you have? The first or "Basic" model did not include a driver tube protective circuit and therefore didn't have the K-10 relay. Look at the nameplate on the front of your RF (top) drawer. If it says "Transmitter T-368/URT" with no letter suffix (i.e., T-368A, T-368B, etc) you have the Basic model and therefore no K-10 to worry about. I have a Basic which I have been using for 15 years now with no driver tube problems.

Sandy,

Thanks for the response but this was not for sending or receiving characters electrically, rather used by the operator to transcribe the CW characters coming in on his headset. Pretty much a standard portable mechanical typewriter of the period but printed out upper case letters only along with certain other special characters. Similar, full size machines widely used by on ships and fixed-plant communications sites during WW2.

From: Thekan, Paul
Topic: 5645  Message: 5650

The portable typewriter I have , as used on the SCR 299/399/499, is the Remington portable 'Deluxe Model 5" Mine happen to have been used by the Navy and are a light grey with USN on the front of the typewriter above the keyboard. The Army version I think is black. There is an ad in a war issue of Radio News showing the typewriter as used on the SCR 299.

The military version looks physically just like a standard Model 5 with the exception that it is upper case only and the zero key has a slash through it. There was another change on the keyboard numbering but I can't recall what it is now. If one cannot find the cw mill version , there are lots of the 'regular' Model 5's out there.

Listed in the relevant manuals only as "Typewriter, portable, with
telegrapher's keyboard, including case." No manufacturer, model,
etc. listed. Anyone ever seen one of these and/or know more? Have
heard surviving examples are rare.

Hi Jim,

Long time ago now. I was stationed at Herzo Base, near Herzogenaurach. Like
you I still have a few
items from that time period, R390, R389, R391 and etc. Also have a T368E. I
have a very early mill made by Underwood and a later one made by
Remington, a model seventeen that is marked Signal Corps and is also marked MC-88.

I was the Trustee of Mars station DL4SZ and my own call was DL5IW.

Sandy,

Thanks for the response but this was not for sending or receiving characters electrically, rather used by the operator to transcribe the CW characters coming in on his headset. Pretty much a standard portable mechanical typewriter of the period but printed out upper case letters only along with certain other special characters. Similar, full size machines widely used by on ships and fixed-plant communications sites during WW2.

Hi Alan

Yes , I know you've been looking for a long time. A standard Remington Model 5 will physically look like the cw mill version you so desperately seek and could be a place holder until you find the real cw mill version.

Hang in there Alan , one will show up when you least expect it.

Very good Alan. I'm sure one will show up long before you 'leave us'. Good deal on finding the generator part of the PE 95. I have a PE 95 here too that is set up for 220v 3 phase but has US Navy tags on it. It had been used at our old Eimac plant in San Carlos for a stand by gen set for the guard house. Have never fired it up after saving it from being scrapped out when we abandoned the plant.

I have a mill that I bought a few years back. I think mine is based on a Royal Arrow typewriter. I don't recall whether it has any service branch indicated on it. I had to do a LOT of work on it to free up the keys. The machined casting holding the center links for each type bar seemed to have swelled shut around the links, and I had to remove all of them and laboriously scrape each slot to allow the links to move freely. Now the typing function works well, but it still intermittently advances the carriage two spaces instead of one. I haven't tracked down the cause of that problem yet.

hello bob, as the SCR399 is about 1944 , it would be best to find one of around that period. of course the set up was still in use dduring the korean war and even in vietnam with the collins rx , so i suppose it really does not matter. i would really like to learn how to take morse down directly on to a keyboard. i know i am 78 , but it is good for an old dog to learn new tricks ! incidentally , i was taught morse by the canadian soldiers , as this place was in the middle of an army camp , and still is a military training area. i was really brought up by them i suppose. we also had americans for a period, and that was when i fell in love with the BC610.
amusingly , before D day there were some radio trucks parked on the road goinng tthrough the camp , and beside them was a pile of the little steel ladders which fitted on the back of the truck to climb up with. i really wanted one of those , so not wishing to steal one , i just removed the top ladder and put it in the grass beside the road , hoping they would overlook it. sure enough the day after they pulled out , there it was. it took me 60 years to get the truck to go with it ! alan G4GEN

Hello Paul.

Thanks for the info about your mills. I have seen other mills marked the same as mine and I have seen a lot of them that are unmarked that were used by the military as cw mills so I don't understand the difference in identification but I believe they are rare or becoming rare as I haven't seen any recently for sale. I purchased a Remington Model 17 typewriter for spare parts other than the keys for any future problems.

Alan,
Thanks for all the info. It is not that hard to copy cw on a mill, I suppose easy for me to say but if I can do it I am positive you can too. I had a chance to get a BC610 years ago and was discouraged by other hams who said it was a harmonic generator and since I didn't have any personal knowledge about the 610 I passed on getting it. I do have the newer T368E model that I have had for years.

Do you have a website for your truck/radios/genset, and things that it's "starred in?"

This particular Yahoogroup strips off attachments, so you'd have to upload it to Files and then let us know where it is in files. Thanks!

Ola, Que Pasa, there Buddy,
I am doing ok now, visiting the VA hospital and such, keep running into people that "Have no security CLEARANCE, who want to know how I managed to die and am not still "DEAD"! The VA here sent a request to Walter Reed Army Hospital, and
they were told,,,
Yes the patient was dead but he isn't any longer as far as we know, and the information you requested on Him (Me) is only available if you have the right
security clearance, and a "Need To Know". Please submit all further enquiries
to The CIA at Virgina. Be advised proof of necessary clearance is required!

When I was in Germany I was stationed at Frankfort, Bad Toltz, and shaffenBurg.

We gotta get to gether via email, more offten.

I am in a new house/home and after a false start single again, because the lady
wanted to run everything here and so I sent her and the rest of her family packing.

Got the BC-610 up and running (I) model so far, (E) model is next, should be on the air again with them soon. Got low power stuff and CW/SSB capability now.
Tomorrow I put up the end fed long-wire oriented North South and will most likely
be on CW in a couple of days.

My only complaint now is its too quiet here all alone. Gonna have to find a "Lady that is NOT DIFFICULT to live with.

Maybe NOT cause I am 64 and can NOT tolerate the B.S. anymore!!!

But back to radio I have receivers and a complete Heathkit Station running
like I said putting the BC-610s back together, will be on AM/CW soon too.

How are things with you, (Write Damm-it) LoL

Hi Alan,

I have a "Message Book M-210-A, Signal Corps, US Army" if that's of any help? Perhaps someone who is ex-US Army can comment on whether this book is of the right era. It is a duplicate book, that is it has a carbon copy of each page. Can scan the relevant pages if required.

Bob,

The database is in the files/database area of the group.

It has everything I was ever given for changes and updates.

Be aware that there is NO distinction between models!

The database lists ALL Models, even an HT-4 or two.

The latest I have of the database, in multiple formats, is dated July
28, 2012.

The two copies of the database in 1) Excel and 2) .CSV formats are attached.

Sincerely,
Bob Bethman, (USA SFC Ret. [1988] )

Guys,

I just acquired a nice original condition BC-610-C last weekend. I need to see if I can source one of those little conical ceramic heaters used to drop the voltage in tune mode. Does anybody know where I can find that element? I would also like to find a decent operators guide (I think TM 11-280?). I can find the repair manual on-line but I can't even find so much as a photograph of another "C" model on-line.

Anybody else have one of these?

The conical screw-in heating element was used to drop the high B+ up
through the -E model. The two on eBay do appear to be the correct wattage.

TM 11-280 is the technical manual on SCR-299. I have a reprint available.
Includes Change 1. $26.30 plus shipping.

I also have one original (not for sale) of TM 11-4057. If there was any
interest in a decent copy, I would reprint it.

# 5703. Ernst Krenkel/RAEM 110th anniversary

Yahoo group: T-368_BC-610
Date: 2013-12-10 07:20:41 UTC
From: <Roger@...>
Topic: 5703  Message: 5703

I see the Russians are celebrating the 110th anniversary of the birth of Ernst Krenkel, callsign RAEM, who was a famous Arctic radio operator. Krenkel was given all sorts of awards for his actions in saving a polar expedition and he was presented with a BC-610-E for his personal use, see:-

http://raem.srr.ru/books_and_tales/raem_ek_by_ym_r5gm.php

The details of the special-event stations active during December 2013 can be found on:-

http://www.southgatearc.org/news/december2013/special_event_celebrates_soviet_arctic_explorer_and_radio_amateur.htm#.Uqa-keKPMf4

Be fun to work them on a '610, although from the photos it looks as though his TX has seen better days!

Guys my T-3 is in need of a bit of help. Seems to not have any grid current, when I key up there is a slight amount of grid current on the meter, I have replaced the 4-400 and still the same, there is plate voltage. When I try to attempt to tune the transmitter this is no effect at all by adjusting the Power Amp Loading or the Power amp tuning controls

Any thoughts??

# 5708. T-368 hex wrench

Yahoo group: T-368_BC-610
Date: 2013-12-30 21:40:13 UTC
From: <donrdlph@...>
Topic: 5708  Message: 5708

Hello all,
I am thinking of having some reproduction 3/8 inch T handle hex wrenches fabricated for the T-368.
I am sure that a lot of T-3's have them missing.
I took all of the measurements off of an original one.
My machine shop guy is going to send me a sample unit.
Would there be any interest in anyone purchasing some of these if the price was reasonable?
Just thinking out loud.
Thanks,
Don W9BHI

I would be interested in one. I tried ordering a T-handle wrench from McMaster-Carr of the same style as the one shown in my T-368 manuals, but its handle was about 2x too wide to fit in the storage area on the side of the transmitter.

The caveat I'll throw in is simply that I have never seen a T-368. Only pictures.

One may consider looking at Harbor Freight. Yes, they indeed are cheap. They sell them in sets that are SAE and Metric.

The size could be looked at to determine if it will fit.

It may be an inexpensive way to get there. My son and I both have procured one of these sets.

They have served for years of miscellaneous hobbies and work.

Subject: [T-368_BC-610] T-368 hex wrench

Hello all,
I am thinking of having some reproduction 3/8 inch T handle hex wrenches fabricated for the T-368.
I am sure that a lot of T-3's have them missing.
I took all of the measurements off of an original one.
My machine shop guy is going to send me a sample unit.
Would there be any interest in anyone purchasing some of these if the price was reasonable?
Just thinking out loud.
Thanks,
Don W9BHI

# 5714. BC-610/BC-614 interconnect cable

From: <w0ir@...>
Topic: 5714  Message: 5714

I just pulled my BC0610-I out of storage and can not find the interconnect cable, so I need to make a new one. I have the BC-614 manual, but it does not show if the 2 audio leads are in a separate shielded cable inside the harness. Does anyone remember if they were? Also if anyone has a spare interconnect cable they want to part with, please let me know. Thanks
Dale W0IR w0ir@comcast.net

The original hex wrench for a T-368 is a bent-in-a-loop T-handle style with an uncommonly narrow handle. There's a pair of clips in one of the handle indents to stow it. Any old 3/8" hex wrench will turn the screws, but nothing at Harbor Freight is similar to the original or will fit in the storage clips. This is something that would be of interest to folks like me who wish to replicate the original T-368 kit.

Mark,

I did say that I've never seen a dyed the wool live T-368. My comment
was just a "possible" alternative. I certainly have not seen the
tool(s) that they came with.

This is like finding the original tools that were in clips on the back
chassis panel on R-390s and R-390As. These being the original Bristol
Spline wrench and Phillips screwdriver. The term "as rare as hen's
teeth" comes to mind.

The 390/390A wrenches do indeed exist, and I have one, bought from a guy who worked for the Signal Corps and acquired a batch of NOS ones that were getting thrown away some time in the '70s. If only the little Bristol bolts and setscrews on my 390A hadn't been buggered up by attempts with ordinary hex wrenches...

Mark et-al,

Never seen an example of the original item. Do have a "T" handle unit
I use but different style.

Not according to SIG 5. CD-764, (Sig. Stk. Nr. 3E1764) 0.437" dia. C/o seven #20 tinned copper conductors, cotton over rubber insulation, single shield around wire bundle, 14' LOA. Amphenol octal connectors each end. I think I still have some of the connectors available.

I haven't seen a CD-764 for sale in maybe 15 years.

Not a frequent responder to the T-3 postings...but, the possible production of some authentic wrenches is intriguing....*In days of old, the Bristol Wrench and Philips screw driver that were custom tools for the R-390x's were produced by someone on that thread...quite a few years ago...Don't remember who made them and made them available to the group...there was much excitement and I think all were sold on a pre order to justify cost of the project...**
**

Just to be clear: Are we all talking about the T-handle 3/8" hex wrench that clips into one of the handle impressions on the side of the T-368 cabinet, and is used on the big socket head screws that secure each drawer in the cabinet?

I do not recall whether it should also have any small spline wrenches clipped inside. If it should, then I would also be interested in originals or reproductions of those, as well as originals or reproductions of the tools that should be clipped on the back of the R-390A receiver.

Hi Robert

Thanks for your response. I wasn't sure of the wire size. Built a new interconnecting cable this morning in used shielded audio cable for the audio lines and #20 for the balance of the cable. Cable laced it all together and got good audio reports on 3730 when I tried it out.

Now that I built the new one I am sure to come across the original one. Lol.

Thanks again and have a great new year.

73's

Mark,
This is the hex wrench that is stored in clips on the right side of the cabinet in the recess where the handle resides.
There are no other tools that I know of that came with the T-368.
Also, there are no spline type set screws on my TRW made T-368F.

Well, I did build up my courage and ventured down into the basement. I had no hope of finding the T, but, I lucked out and found it, stuck into one of the hex screws on my T-368F. Almost 6 years ago, my water heater bottom fell out, and, I wound up with 2 inches of water, evenly distributed, on the floor of my 2000 sq. ft. basement. Everything ferrous of course suffered, along with many other items. I just took a quick photo of the wrench and will try and attach it. I can take a better photo and measurements later, if there is an interest. If the reflector will not allow attachments, I will soon find out, maybe someone will volunteer to host it. 73 - Mike

Well, I did build up my courage and ventured down into the basement. I had no hope of finding the T, but, I lucked out and found it, stuck into one of the hex screws on my T-368F. Almost 6 years ago, my water heater bottom fell out, and, I wound up with 2 inches of water, evenly distributed, on the floor of my 2000 sq. ft. basement. Everything ferrous of course suffered, along with many other items. I just took a quick photo of the wrench and will try and attach it. I can take a better photo and measurements later, if there is an interest. If the reflector will not allow attachments, I will soon find out, maybe someone will volunteer to host it. 73 - Mike

Yes it does actually. Didn't get my wrench with the T-368 and until
today both the clips on the side of the cabinet had been oriented
horizontally and I never paid much attention to them. Just rotated
both 90 degrees and the wrench fits FB!
Trying to post a picture but am having trouble with the site....

I assumed the bent-in-a-loop style based on the line drawings in one of my manuals that I saw (unless I fabricated that memory, which is also possible). I haven't seen an actual confirmed original tool in real life. It's entirely possible, of course, that the line drawing in the manual doesn't match the real wrench. Maybe the draftsman was told "draw a T-handle hex wrench" but wasn't shown the one that would be included with the transmitter? Or maybe the type of wrench included varied over time, or between manufacturers.

The T-handle type that was just posted would be easier to fabricate.

# 5740. Strange Fuse holder and disconnected S4

Yahoo group: T-368_BC-610
Date: 2014-01-08 00:23:43 UTC
From: K3PID
Topic: 5612  Message: 5740

I am going over my T3 looking to see what has been done to it over the years and I discovered an apparently unused fuse holder mounted to the vertical divider panel of the RF deck just above the oscillator multiplier assembly. It looks like it would hold a 3/8" dia cartridge fuse but there is nothing in it nor are there any wires to it. Any ideas about why it is there? Also, someone has cut the wires to the microswitch S4 which opens when the PA Band Switch is between stops. The switch appears to be fully functional but they have cut it out of the circuit shorting the wires together. Any ideas why?

Just trying to figure it all out....hi hi

From: <donrdlph@...>
Topic: 5745  Message: 5745

The samples have arrived and they look exactly like the original.
I have 6 and will part with 5.
I can have more made but only in batches of 10.
I think $15.00 each plus shipping is a fair price to pay for a custom made piece.
I don't know how to post a picture here for all to see.
To be fair, I have a list of hams that said they would want one in order of date that I received their messages:

Bob K6OSM
Mark NF6X
Trevor KD1YT
Gene W8KXR
Gary W1PG

If there are more than 5 more requests, I will have another batch made.

Please send me an Email using the address on my QRZ lookup page and I can send you a picture.
Thanks,
Don W9BHI

# 5749. T-368 Hex wrench

Yahoo group: T-368_BC-610
Date: 2014-01-10 01:00:25 UTC
From: <donrdlph@...>
Topic: 5745  Message: 5749

I have got more responses than wrenches but never fear, I have placed an order for 10 more. I had asked in a previous email that you contact me at my email address on my QRZ page if you want one of these wrenches for $18.00 shipped to your door.
I am going to ship only one per customer for now being that I only have 5 to sell but after the next 10 show up , I will ship more.

Thanks,
Don W9BHI

It depends upon (assuming you have an original) whether the connector is dogbone or cathedral style. Cathedral comes apart by remove three screws and splitting the back of of the plug. Dogbone style requires a special 3-pin cylindrical spanner to unscrew the externally threaded ring that holds the guts in. Fair used to sell sets of the spanners.

Hello,Robert;

We have communicated in times past but not in last couple of years. Were you the person who printed and distributed the NAVSHIPS R-390A Manual?

*I have three of the connectors in question. All are "L" shaped and have the external threaded, ring cover plate with four (4) slots that I assume would require the spanner wrench. One has this cover plate removed but I see no means of further disassembling the unit. Could you possibly amplify on further dis-assembly.**
*
Gratefully,

Harold

> I have three of the connectors in question. All are "L" shaped and have the external threaded, ring cover plate with four (4) slots that I assume would require the spanner wrench. One has this cover plate removed but I see no means of further disassembling the unit. Could you possibly amplify on further dis-assembly.

The connector needs to be unplugged form its mating socket, or else the bug thumbscrew will prevent it from being disassembled.

Once you unscrew the externally threaded ring, it should be possible to remove the rear cover of the plug by pulling on the big thumbscrew handle. There are O-ring seals which may have hardened, and they can make the cover hard to remove. Once the cover is off, the terminals will then be accessible.

Here's a picture I had sitting around of a disassembled connector:

https://www.dropbox.com/s/riqh8871fp6vqfp/IMG_1685.jpg

Does that help?

By the way, I might as well share a couple more pictures showing how I fabricated a breakout box for the rear-panel connections on my T-368C:

https://www.dropbox.com/sh/nar87yqnuc7bgd8/CdBW15vW3n

I never got around to taking pictures of the finished build. The cover plate that I added has two 3-pin XLR connectors for 600 ohm audio input and sidetone output, and two 1/4" plugs for PTT in and receiver blanking out. Inside the box is an audio transformer for the 600 ohm input so I can drive it with a balanced signal. I added a magnet on the back of the outlet box to help support its weight so that it doesn't put so much stress on the connector. The sidetone output doesn't seem to be working for me yet, but the other three connections work fine.

Maybe I'll take some more pictures and write up the project on my web page one of these days, but it'll need to wait until I find the gumption to roll my T-368C out of the corner it's crammed into.

Harold,

No, I've done about 1500 manuals on Army, Navy and blue suiter radios but I didn't do that one. I vaguely recall that it was done by a consortium but can't recall any of the names or calls.

Once you have the threaded ring out (the spanner, incidentally, only has three pins. One side is cut away), you just grab the butterfly on the coupling screw (or nut on the Vietnam era connectors) and pull. The only thing that should be still holding it in is an O-ring. The cover plate is a separate part from the ring. But it is captive on the screw/nut.

I replaced the bearings in both my cabinet and PA fans. I think the bearings were meant to be maintenance-free, but we're using these rigs way past their expected service lifetimes. Some folks run their rigs without the cabinet fan to reduce noise, particularly since we're generally not running 24/7 100% duty cycle FSK like they were used in service. The PA blower is mandatory, though, and it's worth it to keep it running in top shape.

I'd recommend at least inspecting both blowers and making sure they spin perfectly smoothly. If they drag at all, you can try to lubricate the bearings to see if that helps. If they feel at all clicky or coggy, then replace those bearings with new ones. Especially in the PA blower. You'll probably need to disassemble the motors to get access to the bearings to lubricate them anyway, and at that point it's not much more effort to swap in new ones if there's any doubt about the condition of the old ones.

Though I don't remember the bearing size off the top of my head, they were a common size and I bought new ones from McMaster-Carr for not much money. And note, even though these are 1950s US radios, we had already standardized on metric bearing sizes by then. I first assumed they were inch-sized bearings, measured them, and ordered the closest inch size. They were much more expensive than the metric bearings, and they did NOT fit on the shafts or in the housings. Then I switched my calipers over to mm mode, and found perfect integer millimeter measurements. The metric bearings I got then cost half as much, had a much higher RPM rating, and fit perfectly.

I replaced my excitation meter with a similar-looking but not original meter. I had to replace the shunt resistors due to the different meter coil resistance.

I also had to replace my filament voltage meter. I used a similar-looking but not original meter there, too, but it was a simple replacement since it's just a voltage meter and the circuit doesn't depend on it having a specific resistance.

I think I still have my original meters stashed somewhere. Repairing them is a bit beyond my ability at the moment, so that's why I replaced them with random meters that I found on eBay.

Dennis,
Yes, the original shunts are there.
The meter movement is sticky and no amount of adjustment and fiddling will make it work properly.
The original meter has a 3.33 ohm impedance.
I don't want to have to redesign the shunts for a meter with a different impedance.

Don,

Acquiring an original meter could be a long term proposition. Making shunts not particularly difficult though. A friend of mine NF6X <nf6x@nf6x.net > did this for his T-368 and you might contact him for more information. I've done this cut-and-try using fine enamel covered wire and carbon resistors for bobbins. See 3-inch, 15ma meters going for $15 - $20 on eBay currently.

Good luck.

Hi. I replaced my shunts with a combination of standard fixed resistors and trimmer potentiometers. I disconnected the original shunts from the circuit, but left them in place in case an original meter turns up. It wasn't too hard to do. I didn't take pictures, but I can take some if it would help.

I would have preferred to just replace my meters with good original ones, of course, but I didn't feel like waiting potentially forever for them to turn up. So I adapted the meters I could find in order to put the transmitter back on the air.

My original meters and Don's as well are probably repairable by somebody with the right skills... but that's not me! That mysterious person with the right skills might also be able to fix my commo van clock whose flywheel seems to be a bit too loose in its jewels.

From: K3PID
Topic: 5780  Message: 5780

I am looking for the specifications for K6 ( Power Supply Deck) in the E series of T-368. Does anyone have ( or know where I can get ) the parts and special tools manuals for the T3?

K3PID Ron H.

The relay is a DPDT with high current contacts and 115Vac coil.
I replaced mine with a solid state type ( 120Vac 40A rating with 120Vac control).
Nice and quiet.

Sealed plate relay used in later T-368s, common failure point when operating in the PTT mode like we hams do most of the time. The large, open-frame units used in earlier models stand up better but will also fail after prolonged use. I replaced K6 in my Basic model with a 35 amp mercury plunger type (lots of these available on eBay). Others have used the solid state replacement units successfully. An alternate mounting arrangement will have to be rigged up in either case.

# 5788. OK, Strange CW Wave Form

Yahoo group: T-368_BC-610
Date: 2014-02-09 18:43:13 UTC
From: K3PID
Topic: 5788  Message: 5788

Almost ready for prime time but the CW wave form as observed on the SB-610 scope has a half power front porch. Fast rise time to about 50% then a couple of millisecond front porch then full power for the rest of the pulse. Width of front porch does not seem to vary with keying speed. Could this be a relay issue? Almost seems like the exciter is being keyed early...

Ron,

Presume you are talking about a T-368 here. Can't recall an issue with operating these radios on CW ever coming up on this forum before and I've never operated the radio on the air in that mode. Interesting....

In the T-368 the first and last stages in the exciter are grid-block keyed and in the CW mode the PA is finally "keyed" courtesy of the clamper tube (V2) getting cutoff bias when excitation reaches and is rectified at the grid of the 4-400. Several things happening in sequence there so maybe what you are seeing on your scope is normal. Anyone setup to confirm or refute this? How does your "stepped" CA note sound on the air BTW?

Bob,

For the past 30 years or so, the commercially available 2-pole twist-lock female cable connectors have been .015" to .020" too large in diameter to go into the original recessed males like the one used on the BC-610. And the wall thickness of the plastic used was much to thin to even think of turning the diameter down. Do you have a current part number for the one that you found recently that actually fits?

Brian,

By coincidence maybe U-7/U is the 10-pin female cable input power connector for the T-47/ART-13 et al. Do you really mean for the BC-610 or do you really mean U-7/U?

Robert,

The two pole twist lock was purchased at Lowe's in the last 10 years.

Fits just fine.

His second post indicated that he was looking for the Amphenol connector
for the ART-13.

Bob,

Right, on the U-7/U. He contacted me direct.

On the BC-610 AC power connector, I'll have to pick a current one up and check it. Someone may have finally caught the diameter error. Back in the 1990's, every one that I checked was just a little too large. Can you look at yours and tell who made it?

I'll add (as I have off and on for 20 years) that if you can find an old black bakelite one, regardless of which rating it has, if it doesn't plug in because of the shape of the slots in the face you can modify it to work. Takes just a few minutes work with a hacksaw blade, jeweler's file or something similar. All of the contacts inside are the same in all face styles. The slots in the face are cut on an arc. Running out on a radial is from one end of one or both slots is a short slot. Which end of the arc the radial slot is on and whether or not both arcs have a radial slot is how the various rating connectors are differentiated. All that you have to do is add the radial slot in the necessary position.

# 5795. BC-610, BC-614 and BC-939 For Sale

Yahoo group: T-368_BC-610
Date: 2014-02-18 02:30:49 UTC
From: Tom Bridgers
Topic: 5795  Message: 5795

A general description of the BC-610-F, BC-614 speech amp,
and two BC-939s are below as a last section of this email.

Also if you'll click on the hot link below you'll find photo's of
the transmitter, speech amp, and of one of the BC-939's:

http://picasaweb.google.com/radios4fun/BC610#

The BC-610 must be sold first before I'd be willing to sell the other
components of the system.

All items are FOB Greensboro, NC.

If you live near Greensboro, and would like to visit to see the gear
first hand, I'm sure we can work out a mutually good time and date.
I'm retired and my schedule is pretty flexible.

.Also I have two WRL Globe Champions that need a new home.
One is in operating condition, according to the guy I purchased it
from. I have not fired it up however.. The other is complete, but I
have not put it on the air and it probably has some issues. I'm
asking $ 395 for the one that works, and $ 195 for the second one.
If you are unfamiliar with a Champion 300, it is VERY heavy --
about 125 lbs. Both FOB Greensboro.

Would be glad to answer any questions you might have either
on line or by phone: 336-558-3762.
73's,
-Tom KE4RHH

---
---

4 ea BC-610 components For Sale.
A BC-610 Transmitter, BC-614 speech amplifier and two BC-939
Antenna Tuners.

Item 1. Model: BC-610-F made by Bogen.

What is included? A manual, 6 RF final coils, 6 ea tuning
units, all tubes, 2 ea replacement high voltage capacitors (each 4 mfd @ 4000
volts), 4 tuning cards, power plug to 120 VAC.

PA Final Coils: 2-3.5 mHz, 3.5-4.5 mHz, 4.5 – 5.7 mHz, 5.7 –
11 mHz, 11 – 14 mHz, and 14-18 mHz. As is generally true
of coils this age, some of the coil holding plastic is crumbling. However many
hams use non-conductive, epoxy glue to hold the turns in place.

All tubes are included in
including the 250TH, two 100THs, along with two 2A3s.

Condition? Is in good condition. I have not operated it because the two high voltage capacitors were removed when I purchased it and have not been reinstalled.

Asking price? $495 FOB Greensboro, NC

Item 2. Model BC-614 Speech amplifier.

Condition? Is in good condition. I have not operated it, and I’d imagine, given its age, it would need the usual cap replacements and troubleshooting.

Asking price? $225 FOB Greensboro, NC

Items 3 & 4.
Model BC-939 Antenna Tuner. I
have two of these.

Condition? One is in excellent condition. The other is in good condition.

Asking price? $ 225 for the excellent condition unit, and
$175 for the other one.

From: <wc4don@...>
Topic: 5796  Message: 5796

I have a T368 for sale. It's really in great condition and it was working until I pulled the 5R4 tube out to clean a relay that I see was arching. After I cleaned the contacts I fired up the T3 and it blew a fuse right off the bat. I looked over and seen that I hadn't put the 5R4 tube back in. Upon doing so I tired to fire it up again, but it blew another fuse. I just don't know enough to get into tracing and trying to find the problem. I had some friends come over and we got it working the first time when the only problem was plug that went on the back with the jumpers in it. I wasn't told that had to be plugged in for it to work No big problem .. but now this and I just don't have any help around here to help me get this back on the air. So I guess I'll just sale it and hope it goes to a good home. I can text anyone pictures if your interested .. I have extra tubes and every thing for a full setup including my 390A and the ME 165/G and more .. I paid 1950 dollars for the T3 and I won't take less for it . If your looking for a full AM package I can set you up. As you know this will be pickup only because of the weight .. I have a full set of manuals and I can track the ownership of this radio for the past 20 years. Give me a call if interested at 859-396-2299

# 5803. C41,C42, & C7 replacement??

Date: 2014-03-27 12:33:42 UTC
From: K3PID
Topic: 5803  Message: 5803

My T3 manual(s) which cover thru E all show C41,C42, & C7 in parallel coupling L2 to L4 via the band switch but my T3 actually has one unlabeled cap of 0.0039 µf mounted on an additional phenolic block doing the job. The mounting holes for C41, C42, & C7 are there and obviously they were in use a one time... Was this a sanctioned upgrade performed at the depot late in life or was my unit the result of some previous owner’s handy work?

I discover something new about this T3 everytime I open the drawers... Hi Hi

The several T-3's that I have worked on all had a single 0.0039 mica transmitting cap in place of C41, 42 and C7.
Maybe the real early ones had three seperate caps?

Yes, the early models (my Basic for ex) did use three parallel caps, later models used a single, large ceramic .0039 mfd unit. Don't know at what point the change took place. There was also a field mod along the way to implement the change in earlier sets.

Some worthwhile improvement in the audio quality of the T-368 can be achieved by replacing the .0039 (or equivalent three parallel caps) with a single .001unit. With appropriate voltage and RF current ratings of course.

# 5806. Sidetone Oscillator Pick-up on Keying Line?

Yahoo group: T-368_BC-610
Date: 2014-04-09 16:48:38 UTC
From: <Roger@...>
Topic: 5806  Message: 5806

Hi All,

I've finally put my JB-70A junction box into service and have encountered an odd problem. On CW, the sidetone oscillator is being picked up, I believe, by the keying circuit causing what sounds like FM on a monitor receiver. If I switch the sidetone off the CW note is T9 and if I tune a few kc off the crystal frequency I can hear only faint key-clicks - but if the S/T is on (either BC-342 or BC-312 selected) then the sidebands extend a considerable distance HF and LF of the crystal freq. There is also a small reading on the BC-614-E meter which dies away after I stop keying. If I am on Phone and turn S/T on, the mod meter jumps to 250ma, and I can hear the S/T on the monitor RX, sounds awful! But with S/T off the mod is normal.

I'm guessing there's pickup somewhere between the S/T generator and the BC-610. I have used an 8-core screened cable for the JB to BC-614 link and wired as per the book and I have also tried adjusting the S/T level on the rear of the '614, which doesn't help much. My interconnecting cables, JB to 614 and 614 to 610 are home made. The '614 has been mostly re-capped and has a new mains transformer.

Any ideas appreciated!

An update on this; I made up a new 7-core screened cable to go between BC-614 and BC-610 but this did not clear the sidetone breakthrough. I'm fairly confident that I have the wiring of the cable from BC-614 to JB-70A correct. I don't have a receiver connected to the JB yet, which may, or may not, be relevant.

John,

If it is any consolation, I picked up the latest revised version of a BC-610 in 2003.

It had gone through Depot in July '59.

They didn't silkscreen it nor did they engrave it. Everything is stenciled on it.

They even stenciled the Depot rework to include the date.

So if you end up going that way, I don't think anyone would find it odd.

Whatever changes made, I can't tell, other than there aren't any porcelain insulators on the left side. It only has an SO-239. They simply put the new dataplate that reads T-213 right over the original.

I forgot to mention earlier that of three T-213/GRC-26 I bought years ago,
two were silk-screened and the third appeared to have been done by hand.

And as best I can recall, they all had the coax output MWO applied (SO-239
in place of the two porcelain insulators).

Hello all, I'd like an idea what the original government contract price was for the t -368.

I searched the data base for this group and found nothing.

In an conversation I had with another ham, the idea was postulated that the new price was easily that of a new car .

Should this be true, in today's money, that translates to 35 to 40 thousand dollars.

Any thoughts?

Sorry, the 5820's only go up to 5820-498-nnnn that year. Presumably the T-368 was still listed under the SigStkNr. And unfortunately, very seldom did they use the set nomenclature buried in the stock number.

The T-368 might not have made the 1955 price list anyway as the earliest TM date, TM 11-809, is dated Apr 1955.

I can tell you that a BC-610-E is listed at $1750 and a BC-610-H at $1610 in 1955. This probably included a set of tubes, coils and tuning units but not for example the BC-614 or BC-939. So a T-368 was quite likely a bit more.

# 5826. TU-61 & 62 - Use Of?

Yahoo group: T-368_BC-610
Date: 2014-06-02 06:02:01 UTC
From: Roger@...
Topic: 5826  Message: 5826

Hi All,

At a local hamfest yesterday I found a seller with two TU-61 tuning units and two TU-62, all in apparently good external condition. I bought one of the 61 units as I have a PA coil to go with it but don't have any plans to go on-air with them! That led me to wonder why would the Signal Corps need a TX on 1 to 1.5 Mc, did they use them as broadcast equipment or what?

hello roger , the US forces did indeed use the BC610 for local AFN broadcasts. the W/S53 which was the british replacement was specifically designed with this in mind . as europe was loberated broadcast ststions were set up in church crypts with the antenna going up inside the steeple. the germans were fairly quick to catch on to this . and used to shell the churches. i was told by the son of one of the designers that his father was setting one up and a shell hit the church . he was crouching down in front of the tx and it supported the rubble , thus probably saving his life.
i am told that diana dors made her first broadcast on a BC610 . according to one of the instructors when i was learning to fly , he gave her a lift home after a mess dance. she was always hanging round the base. alan G4GEN

OK Alan,

Very interesting and I bet the BC-610 or the WS53 would be a good thing to hide behind when the shooting starts! I see the optimum antenna length for around 1 Mc/s is given as 150 ft in the manual, a convenient length for the average European church spire and would make a nice vertical. Perhaps you could offer the SCR-399 as a local AM station at the next War & Peace Show?

Tested the new TU this morning and it seems to work OK on both crystal or MO with the exciter power on but I see you have to modify the wiring around the PA RF choke if you want to come down that low in frequency, otherwise you risk burning out the choke. Think I'll pass on that. The BC-939 also needs mods to act as a loading coil.

By the way, I am finally going to use the JB-70A I got from you, Jan/PA3HCO is supplying me with a cabinet for it and that will allow PTT and give CW sidetone, something I've never had working before, plus James/MU6GCI has let me have a cable for the JB-70A to the BC-342N, so will be bringing that RX into service soon.

Hope to be on the D-Day net on Friday, will try and get on 5317 in the afternoon with the TCS.

73

A few years back there was a fellow up in the Salt Lake City area i think who did meter repair. A w7 but can't remember his exact call or name. Think he hung out on the Boatanchor list on QTH.net. Don't know if he is still around or not.

wrote:Acquiring
an original meter could be a long term proposition.  Making
shunts not particularly difficult though.  A friend of mine
NF6X <nf6x@...>  did
this for his T-368 and you might contact him for more
information.  I've done this cut-and-try using fine
enamel covered wire and carbon resistors for bobbins.  See
3-inch, 15ma meters going for $15 - $20 on eBay
currently.
Hi. I replaced my shunts with a
combination of standard fixed resistors and trimmer
potentiometers. I disconnected the original shunts from the
circuit, but left them in place in case an original meter
turns up. It wasn't too hard to do. I didn't take
pictures, but I can take some if it would
help.
I would have
preferred to just replace my meters with good original ones,
of course, but I didn't feel like waiting potentially
forever for them to turn up. So I adapted the meters I could
find in order to put the transmitter back on the
air.
My original
meters and Don's as well are probably repairable by
somebody with the right skills... but that's not me!
That mysterious person with the right skills might also be
able to fix my commo van clock whose flywheel seems to be a
bit too loose in its jewels.

Barry mounts work well with most equipment. Do a Google Images search and they will show up in many different shapes and models. Be advised that the weight ratings vary. You must know the weight of your equipment, total, divide and distribute the weight as per each mount. N8YE

Dave,

You could get a way with using a 100 watt unit in that application.
Even if the clamp tube or screen bypass cap developed a dead short to
ground R4 would be dissipating only 78 watts (2500 volt HV), and in
normal phone operation R4 is dissipating less than 50 watts on key-down.

I wouldn't do that! - Might have a blue spark and the magic smoke will escape... not to say that it could be very dangerous. Remember a BC610 will kill you. I say this with all due respect and you may be very very aware, but just saying... as the kids say today... I hope you have a good big variac to ease the power up slowly.

Thanks for the warning.
I do have some experience with T-368 as I already own one and have had to do some troubleshooting on the H V power supply.
I have downloaded a file on this site on how to power up the PS deck on the bench.
I will try to not let the smoke out of it because it is very difficult to get it back in

Thanks,
Don W9BHI

Don, my ears are itching!

Hello group, thanks for allowing me among your ranks and hopefully I won't be booed and hissed at for having been so lucky! This is definitely one of those legendary, "I heard about a guy who got a ____ for $50!!!" kind of tales. We've all been blessed with finding a piece of gear at less than scrap price at least once, this one just happened to weigh in a little heavier!

The unit is/was indeed in good complete condition, but it was a mouse hotel for quite a while, likely years ago. It looks like somebody left the bottom drawer open, allowing the little varmints inside and have their way with the thing. Luckily very little wiring looks to have been eaten, but the bottom was absolutely full of turds and there are rust spots on every single chassis and transformer from their urine. Cleaning and disinfecting will be my/our first plan of attack.

Long story short, the previous owner was a ham back in the 50's, let his license lapse, and doesn't seem to have much interest in returning to the ranks. The story on this T-3 as he recalls, is that he purchased it at an auction around 15 years ago, for the whopping sum of $5.00 and never fired it up. Apparently this auction contained lots of radio stuff from a wealthy ham in WI who went to prison for something. The full story of where it came from before that, I'll probably never know.

I'm lucky, in that Don happens to be just down the road a few miles and is willing to help me get this beast on the air. It's scary ironic though, as his T-368F is 14 serial numbers older than mine. They very well could have been crated and shipped on the very same day! One major difference, is that I will be looking for the antenna coupler unit that bolts on top. I run ladder line and wire, so why not! I have a R-390A rack that will make a perfect pairing with the TX.

I will likely spent lots of time searching the archives here, and maybe asking a dumb question or twenty. Maybe someday I can share what I've learned with another mega-anchor "newbie"!

Regards,
Chris kc9ieq

Congratulations and welcome.

Re: the antenna tuner, be aware that it is an impressive unit for what it is (engineered and built hell-for-stout) but it was designed and configured to load low impedance short whips and short wires on well below their resonant frequencies, so it is not really adapted (or readily adaptable (without major hacking) to "usual ham tuner expectations" especially for something like balanced open wire feeders.

Don, my ears are itching!

Hello group, thanks for allowing me among your ranks and hopefully I won't be booed and hissed at for having been so lucky! This is definitely one of those legendary, "I heard about a guy who got a ____ for $50!!!" kind of tales. We've all been blessed with finding a piece of gear at less than scrap price at least once, this one just happened to weigh in a little heavier!

The unit is/was indeed in good complete condition, but it was a mouse hotel for quite a while, likely years ago. It looks like somebody left the bottom drawer open, allowing the little varmints inside and have their way with the thing. Luckily very little wiring looks to have been eaten, but the bottom was absolutely full of turds and there are rust spots on every single chassis and transformer from their urine. Cleaning and disinfecting will be my/our first plan of attack.

At the possible risk of embarrassing Chris just a bit, I'd like to point out that he is one of the youngest hams to frequent the hamfests in the IL-WI area and is just as nuts about boatanchors as any of the rest of us! I'm tickled to see this deal go to such a deserving fella and one that I know will do what it takes to restore and use it!

Since it would be OT for Chris to tell you about his vintage rides, *I* will do so ;-) -- how many of US drive a beautiful white '63 Chevy Impala sporting a Webster Bandspanner and TR-4 under the dash to hamfests? (Yes, he knows the TR-4 didn't come out until 1965 but we've agreed to give special dispensation for this vintage anomaly). Chris also has some kind of GM land-cruiser so he's no stranger to heavy metal or the kind of work that will be required. I'm looking forward to hearing it on the air, and making a T3-T3 QSO!

It's good to know that we're not dying out, and that the technology, appreciation, and knowledge will continue on...

I am in my late 40s and was an anomaly when I became a ham in the early 80s and all of the old timers where I grew up (near Fort Monmouth) were offering to give me old stuff or sell it to me at a pittance, and they thought it odd that this 'kid' wanted any of the "heavy and obsolete" stuff that they were ready to toss. I only wish I'd had cash flow and storage space to have acquired all of the things that crossed my path (I still pine wistfully for the *pristine* Hallicrafters Hurricane 2000 with matching VFO that I could have had for $200, although $200 for me back then was half a summer's income and I needed it to pay car insurance).

Congrats to Chris!!! The most important asset to this hobby are people like Chris!! We should be giving this stuff to the young folks
in this hobby because they are the future of this (and many other ) hobby(ies) My kids don't have any appreciation for this stuff(My youngest son Alex 20 wants my Racal ra17 because it appears in some James Bond movies). Maybe this is my fault, but how can we compete with I phones etc?? The museums are full and auctions here and in the antique radio community are filling up from SK estates and such. It is really refreshing to know of someone who isn't an old grey haired geezer, who appreciates a good T3 and all the other goodies he has. 73 Ross W1EKG

# 5853. Sealing leaky transformers?

Yahoo group: T-368_BC-610
Date: 2014-07-23 17:19:10 UTC
From: Chris Farley
Topic: 5853 Message: 5853

Many of the T-3 transformers and oil
filled capacitors have rubber seals between the ceramic insulators and
housings. These are dried out and cracking on the outside, but haven't
yet started leading. Some of the iron in other transmitters HAVE started to leak, so it's
a WHEN not an IF problem.

I'm thinking to wipe /inject some sort of RTV or silicone sealant atop all
the seals to both create a barrier so air/ozone can no longer attack the old rubber, and to
hopefully prevent any future leaks. I wonder what might be a good candidate that
A) won't
further harm the rubber or attack metal as the sealant outgasses,
B) will be able to
withstand HV and RF up to maybe 5kv, and
C) will withstand
PCB transformer oil in the long run.

Any ideas??

Chris

I do not know for sure how they are with HV (you'd want to check), but some of the Sikkens sealing compounds - Sikaflex and its relatives- are exceptional at adhesion, resilience, temperatures, bonding to less than ideal surfaces, etc. They make RTV look like PlayDoh. Their only drawback is that you _don't_ want to get them on anything that you don't want them on... masking, gloves, etc., are mandatory.

Ok guys thanks for setting me straight on the tuner then.  I still wouldn't mind finding one to bolt atop the TX for the sake of making it "complete", but if it would basically only be a display piece then I won't look hard, be in any hurry, or plan to spend much.  On the other hand, if I ever take the T3 mobile....

This is definitely one of those legendary, "I heard about a guy who got a ____ for $50!!!" kind of tales.  We've all been blessed with finding a piece of gear at less than scrap price at least once, this one just happened to weigh in a little heavier!

The unit is/was indeed in good complete condition, but it was a mouse hotel for quite a while, likely years ago.  It looks like somebody left the bottom drawer open, allowing the little varmints inside and have their way with the thing.  Luckily very little wiring looks to have been eaten, but the bottom was absolutely full of turds and there are rust spots on every single chassis and transformer from their urine.  Cleaning and disinfecting will be my/our first plan of attack.

Long story short, the previous owner was a ham back in the 50's, let his license lapse, and doesn't seem to have much interest in returning to the ranks.  The story on this T-3 as he recalls, is that he purchased it at an auction around 15 years ago, for the whopping sum of $5.00 and never fired it up.  Apparently this auction contained lots of radio stuff from a wealthy ham in WI who went to prison for something.  The full story of where it came from before that, I'll probably never know.

I'm lucky, in that Don happens to be just down the road a few miles and is willing to help me get this beast on the air.  It's scary ironic though, as his T-368F is 14 serial numbers older than mine.  They very well could have been crated and shipped on the very same day!  One major difference, is that I will be looking for the antenna coupler unit that bolts on top.  I run ladder line and wire, so why not!  I have a R-390A rack that will make a perfect pairing with the TX.

I will likely spent lots of time searching the archives here, and maybe asking a dumb question or twenty.  Maybe someday I can share what I've learned with another mega-anchor "newbie"!

Regards,
Chris kc9ieq

On Wednesday, July 23, 2014 1:19 PM, "Chris Farley kc9ieq@... [T-368_BC-610]" <T-368_BC-610@yahoogroups.com> wrote:

Many of the T-3 transformers and oil
filled capacitors have rubber seals between the ceramic insulators and
housings.  These are dried out and cracking on the outside, but haven't
yet started leading.  Some of the iron in other transmitters HAVE started to leak, so it's a WHEN not an IF problem.

I'm thinking to wipe /inject some sort of RTV or silicone sealant atop all
the seals to both create a barrier so air/ozone can no longer attack the old rubber, and to hopefully prevent any future leaks.  I wonder what might be a good candidate that
A) won't
further harm the rubber or attack metal as the sealant outgasses,
B) will be able to
withstand HV and RF up to maybe 5kv, and
C) will withstand
PCB transformer oil in the long run.

Any ideas??

Chris

Chris,

Congratulations on the remarkable find. I hope you and Don get her up and running real soon.

I can't wait for the day to roll my first t-3 or bc610 into the shack.

It's nice to see there are others in the age group enjoying the AM side of the hobby. Hope to hear it on the air this coming winter and have a qso.

At 45, I'm not sure whether I'm one of those young kids who likes the old boatanchors, or an old timer. Y'all be the judge. :)

I paid $1575.42 for my T-368, and I'm super happy with it. $50 would have been a nicer price, of course! I may have found one much cheaper if I waited a few more years and planned for truck shipment, but I paid a premium to grab one when it showed up within a short drive.

Mine came with both the tuner and the FSK modulator mounted up top. I've taken off the tuner and stashed it away so I can set a station monitor scope and frequency counter in that spot, but I to plan to get the FSK modulator up and running one of these days. I keep the tuner for sake of originality, but it can live out in storage rather than in the shack for now.

I remember when Dennis had a T-368 in his little van with his pneumatic telescopic mast on the back. That van sure leaned to the left! :)

Group,

My T3 exhibited the dreaded oil leakage from the rubber gaskets on the porcelain HV insulators.

I removed the transformer, set it insulator up, used a can of brake clean to rid the surfaces of the oil leakage.
The surfaces were ready for the sealer.
Mix up both tubes of a JB Weld packet.

Put it all on.

Make art !

Cause it will barely look like the underside of a transformer when you are done !

I did this and it has lasted for 10 years.
Your mileage may vary. etc

1) The T-213 went through Depot in '59. Lon Cottingham and Robert Downs rescued it still in the crate. It had been destined for disposal at sea.

2) It comes with all original issue cables.

I am open to the idea of "some" trading.

A clean R-390A that is fully functional will drop the asking by $800.

I would also apply the same to a clean and fully functional SP-600.

I am NOT leaving Amateur Radio! I simply can no longer deal with the size and mass of these two beasts!

They are standing on a four wheeled moving man dollies, and those will go with them.

I have a substantial hand truck that handles 700lbs, and straps that take 400lbs a piece.

Those will be available to move them from the Den and out to your provided transport means. However, these items won't go with.

One additional piece goes with this package, and it is one JB-70 that needs a top plate made for it, and requires rewiring just inside, as where it came from had an issue with rodents that decided that insulation was delicious!

NOTE: Absolutely NO tubes will be sold independently!

They are intended solely for the use of the equipment that is being sold!

[ I have no idea why all the extra junk came out with this message! My apologies! ]

The two microphones issued with SCR-399 and 499 were T-17 (the original carbon one) and T-50. T-50 is a handheld dynamic with 4-pin connector. ElectroVoice 600C. Quite rare, at least as T-50.

Hi Alan,

I can find a pile of info on a Google search of T-17 microphones but zilch on an amplified version. I do have a couple of circuit diagrams for using a electret mic with a TCS transmitter instead of the supplied carbon mic. These ccts would probably work with a BC-614-* and you could hide the insert and possibly the preamp in a T-17 housing. I've got 3 or 4 T-17s, all have different output levels but all need you to shout to get any decent mod level. My Shure T-50 works well with the BC-614-E, lots of gain in hand. Same goes for a amplified Astatic D-104.

I got two of my T-17s from the ebay seller "bc191", who is in Holland and sells a lot of GRC-9 accessories.

Good luck with that HT fault!

T-17 apparently became M-15/U. But I think that was pretty much a straight nomenclature change. I don't have the nomenclature of this amplified version but I'm sure that it wasn't still called T-17.

Alan,

No, not that I know of anyway. I think what I told you was M-15/U. Which I think is the one with the thicker mouthpiece and some vents on the OD. I've seen two or three of those but all in terrible condition. A quick eBay search didn't turn up anything but a bunch of unrelated junk.

Sure as do-do!  Now just need to do some final detailing, make up some cables, and figure out how to make room for it in the shack!  I don't want to, but might end up having to take that monstrous shock mount base off and put casters right on the cabinet.

Not sure if this list allows attachments, I'll try sending a few pictures of the unit, and close-up of the PA deck prior to cleaning at Doctor Don's T3 office.

Oh and as for sealing the transformers as preventative maintenance, I think I'm just going to settle for aquarium grade silicone adhesive.  It could always be removed later on and something more aggressive used if a leak still develops.

Regards,
Chris

# 5887. Heavy metal sale Update

Yahoo group: T-368_BC-610
Date: 2014-08-01 15:21:07 UTC
From: rbethman
Topic: 5887  Message: 5887

There is perhaps a misconception as to WHAT a T-213 is.

A T-213 is the very latest version of the BC-610.

I almost every way, other than the porcelain terminals being removed and replaces with an SO-239, they are completely identical!

This one is S/N 65, Made by B&W, and is fully functional.

1) The T-213 went through Depot in '59. Lon Cottingham and Robert Downs rescued it still in the crate. It had been destined for disposal at sea.

2) It comes with all original issue cables.

I am open to the idea of "some" trading.

A clean R-390A that is fully functional will drop the asking by $800.

I would also apply the same to a clean and fully functional SP-600.

I am NOT leaving Amateur Radio! I simply can no longer deal with the size and mass of these two beasts!

They are standing on a four wheeled moving man dollies, and those will go with them.

I have a substantial hand truck that handles 700lbs, and straps that take 400lbs a piece.

Those will be available to move them from the Den and out to your provided transport means. However, these items won't go with.

One additional piece goes with this package, and it is one JB-70 that needs a top plate made for it, and requires rewiring just inside, as where it came from had an issue with rodents that decided that insulation was delicious!

# 5890. T-368 Drifty PTO

Yahoo group: T-368_BC-610
Date: 2014-08-04 21:12:44 UTC
From: Chris Farley
Topic: 5890  Message: 5890

Hi all,

The Cosmos built PTO in that infamous transmitter seems awfully drifty.  At least 4-5kHz in the first hour.  Is this normal?  If I decide to tear into it for rebuilding, is there anything special or different with this particular unit as compared to say, the PTO in a r-390/a?

Regards,
Chris

# 5891. ADDED: SEVERAL MORE 160m Crystals

I only would point out that the BC-610s have a much larger piece of quartz in them.

Even original BC-610 crystals will crack and die any more.

Newly constructed full size crystals were cut and made at the UNY Buffalo, NY campus had a Research professor do this, and tested them under the identical conditions of placing into a TU and oscillator section of a BC-610.

Well over half of them bit the "Wolf Cookie", or if you prefer, the dust!

So be wary and careful with any crystal that goes either a BC-610 or something that is even remotely similar.

You'll end up trying to find more crystals, and having issues.

This is all well documented in discussions between WB2FCN and I.

hello bob , i beg to differ. the FT171 xtals for the BC610 are big chunky things , well in keeping with the tx. however when i opened one up the slab was no bigger than an FT243 or something. of course this makes sense as a given frequency would require the same mass of quarts to resonate. at least one would think so. however i would not imagine the delicate modern ones would find it tough.
that said i used to have a british army transmitter type 76. this consisted of an 807 xtal oscillator driving an 807 PA . they were used by airborne forces to communicate with base. there was no tuning in the oscillator , with the xtal being connected directly between the plate and grid of the 807 . the set had a reputation as an xtal wrecker. the handbook said to keep tuning to an absolute minimum. i had a modern xtal in a 10X case for a low power tx , and i tried it. it functioned for about 5 years and i still use it with my Mk33 haaving sold the 76 years ago. alan G4GEN

Many of the FT171B crystals supplied for use with BC610 transmitters had smaller crystals inside with an adapter and they do just fine.

I have seen hundreds of them.

Best regards - Bry Carling

Interestingly - I came across hundreds of new FT171B crystals that were made in Italy. These are intended for use in the BC610 and 90% of them have the adapter inside and a smaller crystal than the big slab ones. There is no guarantee that the large slab sized ones
will work any better or be less susceptible to cracking. The ratio of thickness to surface area
is probably no different. Recent articles in Electric Radio by Dave Ishmael made a lot of assumptions. The most extreme of these seems to be that anyone other than perhaps one or two eccentric radio amateurs would want to build a single tube 813 power crystal oscillator xmtr and use it as their everyday transmitter. Most of us know better :) - A T368 or BC610 on
the other hand would be an object of great honor and pride in anyone's ham shack.

Happy transmitting!

# 5899. BIG PRICE REDUCTION Heavy Metal Sale meet both trades and it is FREE!

Yahoo group: T-368_BC-610
Date: 2014-08-14 00:01:15 UTC
From: rbethman
Topic: 5899  Message: 5899

BIG PRICE REDUCTION

NO BS! Price is NOW $600 cash at the door for the first to ARRIVE!

I am open to the idea of "some" trading.

A clean R-390A that is fully functional will drop the asking by $300

I would also apply the same to a clean and fully functional SP-600.

If you bring an SP-600 and an R-390A, both clean and fully functional, the YOU get the T-213 package for FREE!

1 T-213, (S/N 65 - B&W) BC-614 speech amp, BC-939 Antenna Tuner.

Tuning units from 2MC through 18MC.

All PA Coils to go with the TUs. (almost two sets.)

Full complement of tubes, number of spares to include 2A3s, 3B28s, 250TH, several 100THs.

1) The T-213 went through Depot in '59. Lon Cottingham and Robert Downs rescued it still in the crate. It had been destined for disposal at sea.

2) It comes with all original issue cables.

One additional piece goes with this package, and it is one JB-70 that needs a top plate made for it, and requires rewiring just inside, as where it came from had an issue with rodents that decided that insulation was delicious!

Is sitting on a "moving man dolly", goes with. Have hand truck that handles 700lbs., straps that handle 450lbs. Bring healthy friend! This weighs at least 400lbs.

NO SHIPPING! Must pickup!

Carrier - 400W - Peak Out - Will exceed legal Input PEP! Must Be throttled by audio gain!

Based on Bird Peak reading Watt meter.

# 5903. BIG PRICE REDUCTION - links to pics

Yahoo group: T-368_BC-610
Date: 2014-08-14 02:02:00 UTC
From: rbethman
Topic: 5903  Message: 5903

Folks:

They aren't cleaned up, they *are* out of focus - I haven't got any method to take pictures that won't "shake" as I try and hold it!

http://home.comcast.net/~rbethman/1.jpg
http://home.comcast.net/~rbethman/2.jpg
http://home.comcast.net/~rbethman/3.jpg
http://home.comcast.net/~rbethman/4.jpg
http://home.comcast.net/~rbethman/5.jpg
http://home.comcast.net/~rbethman/6.jpg
http://home.comcast.net/~rbethman/7.jpg
http://home.comcast.net/~rbethman/8.jpg

These items need to be cleaned! Been here since 2003! Haven't been used since around 2006?

Can't remember.

The tuner has tape residue on it. Goo off should remove it without damaging the paint. No, I haven't tried. Personally I could care less! It only has to work!

I don't spit and polish anything!

The stuff on top of the TX is junk! Will come off when someone gets here!

It has become VERY apparent that members of this list are NOT paying attention!

ONE - I am only talking and posting about THE T-213!

TWO - I am NOT going to do this in bits and pieces! What would I do with all the TUs, Coils, the BC-614, and lord only knows what all else?

THREE - I am in QRZ.com. Don't ask where I am! You have read the posts, you have, own, and use a computer!

I really am astounded!

Maybe they are paying too much attention. Who would want to deal with an arrogant guy like you. I lived in Manassas from 1976 through 1992, and made many great friends there, Had I stayed, we would only have been a mile apart. I had a BC-610, a T-368F on the air which I still have, and so on. If you really want to dispose of that junk, I suggest a more pleasant approach.

Folks,

I made that post with no sleep since earlier the prior morning.

I had been up for more than 30 hours. I'm 64 and I have pretty well known abrasive manner and personality.

I don't understand someone asking for the price on a BC-610 and BC-939. Those aren't in the posting.

Their is a difference between a BC-610 vs. T-213

I've posted so many times to this list, and have even been the person that took over the BC-610 registry.

Pleasant approaches are my norm, however I do get fairly cranky when I've gone without sleep.

Such is the way that life runs, and the world turns.

Hey Bob:

There's no need to apologize to the folks on this list or the other lists where you frequently post grossly off-topic items. No need at all. I've read through all your posts where you describe in intricate detail all of your health issues and other life challenges. I'm sure everyone on this list fully understands and sympathizes with everything you've had to endure. Because we know, because you've told us, just how awful and terrible your life is on a daily basis. We get it dude. We are picking up what you are putting down.

As for everyone else that subscribes to this list, and others where you post, I'm sure they have never had to suffer through anything like the challenges you have lived through - and you've done it like a champ. Everyone, raise a glass to Bob because he deserves it, Hell, he's owed it.

Me? Who me? Who am I to be talking to you this way? No man, I don't have any stories of suffering or toil that would compare to yours - I'm absolutely certain of that. Because I've read your stories of woe and I get it man, I get it. In fact, I was thinking of you this morning Bob. When I walked out of my house and got in my car to leave for work at about 6:15AM, I was thinking about you and your troubles. I was thinking, wow that Bob sure has it rough. I thought about you again when I got that next customer call at about 11:45AM right as I was getting ready to stop for lunch. I was upset, but then I thought of you Bob. I said, wow ya know, Bob wouldn't get upset in this situation. He would soldier through. So, I hitched up my pants and went on to my next customer - no lunch today. But hey, I know Bob wouldn't complain - I'll be damned if I will.

I thought about you again Bob about 5:15PM when I got a call from my Boss asking me to take the last customer call of the day. I told my boss - Yes Sir!. Because I know that's what Bob would do. I got home about 8:15PM tonight - too late for dinner, but I wasn't hungry anyway. I just thought of poor Bob and how he manages to get through his daily crises while always thinking of others. Way to go Bob.

After I got home tonight, I started filling orders for the small business I run from home. I'll keep working on this until bedtime about midnight tonight. But, this is a typical day for me and has been for about 38 years. I typically work about 65 hours per week on my day job and about 10 to 15 hours per week on my home business. Back in the day, I also worked a third job on the weekends, but my doctor recently asked me to slow down a bit - so I have.

But hey enough about me. We all know my life challenges don't come close to what Bob has had to endure. And Bob you do it all while staying cheerful and helpful to everyone in every situation. I don't know how you do it brother. You are amazing. Keep it up and please keep those off-topic posts coming.....on all the lists. We are all eager to follow along with all your troubles and life challenges. Because Bob, we get it, we get it man.

Oh Bob, one more thing – I have one question for you – let me ask you this. Are you a Taker or a Maker? I think I read that you are 64 years old. Wow man, that’s really, really old. I’m sure you deserve to be a Taker after everything and everyone you’ve had to put up with all your life. I don’t know how you do it or have so much energy to be such a giver.

By the way, I'm 62 years old.

73

Hi Folks!

I'm a Taker and a Maker.

I make things happen and I take what flows my way!

I've earned every single bit of grief that I get, and I make my way through life no matter what!

Life is too short to do otherwise.

My issues are mine, I don't want or expect sympathy or empathy!

I appreciate someone thinking about me!

If it helps YOU - then I am glad and happy!

Don't let it get you down!

I can't remember how it was actually written, but it said, "Don't Let The Bast**** Grind You Down!

Remember that one!

Life is what it is. I am ABSOLUTELY positive that there are those that have it much worse than I do!

I'll never be a "Robin Williams"!

All that ever does is destroy the entire family!

I *will* NEVER do that to any of them!

Drive on forward! March into the FIRE! Whether it be flames or weapons fire!

BTW - I taught my daughter as all parents teach their youngsters to run from fire.

Crap, She became an EMT, then decided she wanted to see what her Brothers at the station were going through.

Sure as heck, SHE became a Firefighter!

She was always running FIRST to make entry with the fire axe and the Haligan Bar!

She also spent over 40+ hours in the Pentagon on the immediate call, and did all those hours retrieving remains!

She, as my very good friend, Brother Soldier, and Family Doctor says,
"Has Big Brass Ones Tucked Up Inside!"!

It is so true!

Shoot when you see the whites of their eyes!

I own and concealed carry a .45 ACP Colt, Model 1991A1.

Those that think I have the model number wrong - GO to The Colt website!

They currently sell for over $1K.

I obtained mine from a Brother Warrior Marine in 2006.

That far back they were ONLY sold to Law Enforcement or Military!

Amongst Brother Warriors - We don't ask. We don't TELL!

We accept each other BECAUSE we ARE Brother Warriors!

We are mean, ornery, nasty, and any label you wish!

WE ARE BROTHERS!

# 5912. How far

Yahoo group: T-368_BC-610
Date: 2014-08-15 05:22:16 UTC
From: rbethman
Topic: 5912  Message: 5912

I'll tell anyone plain and simple.

How far will I take?

I don't know, I haven't found the limit!

I use "BFI, "Brute Force and Ignorance".

I refuse to succumb to scumbags whom may try to rob, carjack, harm me or ANY Family!

I will do whatever it takes to stop it in its TRACKS!

I carry a flashlight Stungun. It simply looks like a bright LED flashlight.

It is on my suspenders. It is tied to them with a miniature bungee cord.

I just yank it, slide the switch backwards,, and press the button on the other side.

Put against a person as I press the button.

Then I will decide whether to break *IT* apart, beat IT unmercifully, shoot IT, or call the Cops. (Crap, that would take to long waiting! Guess I could just keep zapping if it moves!)

How much will I MAKE.

Everything and anything! Grief, heartburn, and anything you can imagine!

I make things happen simply because I've spent my life doing whatever it takes to get a train or anything/anybody, back on track!

That folks is Bob!

Folks like me, hate me, love me, or otherwise.

Personally - I don't CARE! It is THEIR issue! Not Mine!

Old Sarge
Bob - N0DGN

ALL,

1) I will no longer be posting to this list. I am out of the
BC-610/T-213 business entirely.

2) Joe Foley will need to get someone else to take over the BC-610
Registry.

There will not be any further posts by me that will get into what was
brought here by other individual/individuals.

The physical issues I have is what prompted the sale of all items in
regard BC-610 and T-213.

All is done and over with.

The T-213 departs here today.

Good luck, and the best to all!

Sincerely,
Bob N0DGN

Well after almost 2 years and more problems then you can shake a stick at my T3 is on the air. Simple things but it took 2 men a lot smarter then me to find all the problems that came up. I biggie was the Cannon plug from the Mod deck to the RF deck .. a little smoked on the outside pins but plum fried to the point where it almost burnt thru the two layers .. that was the big problem and blew 3( R54 GY ) rectifiers before we found the problem .. other then that simple things.. now to get the R390A hooked up to it and get on the air ASAP .. LOL Hope to hear and work a bunch of you all ..

Ok now I have the T3 going now it's time to hook up the R390A to it .. is it safe to just hook up the R390A to the T3 thru the receive outlet on the side? Or should I make a muting relay setup for the R390A? I'm so ready to get this on the air but I still have them little thoughts going thru my head. And I'd just die if I poured 400 watts straight into my R390A .. I hooked up the receiver last night thru the T3 and it worked fine but I had the T3 off . I know the T3 has a relay in it for this job .. but is it safe is what I'd like to know or did you guys go another route ..

Don of course it's safe. That's what the antenna relay is there for.
There are also connections there for the muting.

It is safe for the receiver to simply do that, assuming that your T/R relay inside the T-368 is working properly. And it's probably working properly if power comes out the antenna connector when you transmit and nobody has hacked up the innards. The T-368 will disconnect the receiver from the antenna and short the receiver's antenna feed to ground while transmitting.

> Or should I make a muting relay setup for the R390A?

Doing so will improve your satisfaction while operating. Although the transmitter will ground the receiver's antenna feed at the T/R relay, the receiver will still pick up plenty of stray RF, so you'll need to reach for the volume knob every time you transmit to avoid audio feedback (assuming you're using a speaker). Adding the muting connection makes life easier, and you can always still disable the muting with the break-in relay knob on the front of the R-390A when you wish to zero-beat the transmitter and receiver together.

Pin J on remote control recepticle J12 is connected to ground during transmit by Slow Release Relay K1A (basic model) or K9 (lettered models). This was provided to operate a receiver mute circuit in AN/GRC-26D. Details vary depending upon which receivers were used.

I'm not a tech in any since of the word .. but I know enough to maybe light a light bulb .. I know where the remote plug is and where pin J is .. so your saying if I run a wire up to my R390A to where the Break In screw is on the back of the R390A that will provide the ground I need to mute the receiver .. is that right? I've taken a jumper and turned the knob on the front panel to where the Break In switch says ON and I took the jumper and went from Break In screw on the back to ground and it muted the receiver .. so that's what pin J will do if I'm understanding you right. It just provides the ground when the transmitter is transmitting right ? And will provide a ground and mute the old R390A .. simple enough but just checking to make sure I've looked every where in the books I have an I couldn't find nothing good like this LOL .. thank you so much it means so much to US out there that need help and don't know where to turn to ..

Don,

Short answer is Yes. On the R-390A, with the BREAKIN switch ON, grounding terminal 9 of TB-103 operates the breaking relay which grounds the low-level audio at the top of the LOCAL and LINE LEVEL pots. Among other things. To be on the safe side, I would also run a ground wire from J12 pin E to TB103 terminal 16.

And to make sure that no one has monkeyed with the wiring in the T-368, I would put a voltmeter between J12 pin J and chassis, and key the transmitter. You shouldn't get anything, either AC or DC. Then switch the meter to Rx1 and repeat. You should get about zero ohms with the transmitter keyed. Finally, make sure that J12 pin E is connected to chassis (ground). One of the schematics in the -35 Depot manual shows it tied to the audio line shields but doesn't actually show it as tied to ground. The basic and A model schematics show it tied to both the shields and to ground.

Topic: 5932  Message: 5932

Your right Dave about the T3 being dangerous and that's why when it comes to working on the inside stuff that I leave it to my friends who know plenty. I can recap and change out resistors and stuff on my SP600's and I don't worry a bit about doing that stuff but , I won't mess we high voltages. I was a lineman in the Air Force and I know what it can do and how it does it.. That's one reason it taken almost 2 years to get this rig on the air. I have to depend on others when it's convent for them and I just don't bug them until they ask and they always jump in with both feet .. I have so many projects going on around here it's crazy .. I'm building an amp that runs a pair of 813's but I'm only doing the chasse stuff and my buddy is building the power supply. I built about 60 percent of an ART 13 power supply and with help it's on the air now also .. but I have great respect for the HV .. thank you for your concerns and the hobby needs people like you to warn other who might not know the dangers.. I hope you have a great weekend what's left of it ..

Mike I wrote Dave a message and thanked him for his concerns. I worked on power lines for many years and I have a very good understanding of HV and I've seen several of my fellow co workers who made a simple mistake and they lost either their life's or limbs from it.. So I well know the dangers and I'm also smart enough to let someone who knows more about working with HV work on it then doing it myself. I've built several amps and rebuilt several SP 600's but I know my limits and I seek help in them areas. I don't see where me being an extra class op has any thing to do with me owning a T3 .. I'm a radio operator not an electrical engineer and I admit that myself but I can read a print and I know enough to know when and where to stop and I sure enough know what HV can do. But I thanked Dave for his concerns and it's good to know others have good intentions of helping others out there like me who learn by the seat of there pants and are good listeners and have Great Friends who are always willing to lend a helping hand ..

73 Don and thank you everyone for all that I get from you all

I was just wondering if anyone had used a amplified D 104 instead of the non amplified one. I would think if you cut the mic gain down low it wouldn't be any different then a non amplified one? So if anyone has anything they can help me with let me know .. and if you have another type of mic that your using let me know your using and how you like it ..

Don,

Unless you have modified the mic/line inputs for use with a high impedance source,  you will WANT an amplified D-104.  There needs to be a buffer between the very high impedance crystal mic element, and the 600ohm inputs.  (Termination resistance is less than 25K here, and should be at least 2Meg for a crystal element.)  Also remember you must remove or decouple the DC potential if using the carbon mic input with anything but a carbon mic.

Regards,
Chris kc9ieq

Don,
Yes, I use an D104 with the 70's era amplified base TUG-8 or TUG-9. From memory it is connected via the front panel carbon mic input. There were a couple of minor mods for disconnecting the carbon mic voltage as well as bypassing the clipper. Reports are always good.

I used the amplified D-104 with my T-368 and it worked just fine. Bought the matching mic connector from Fair Radio and wired it up. I did disconnect the carbon mic bias voltage from the connector and taped it up.

Thank you Roger, this rig was owned by one of the fellows who is a member of this group. John had this transmitter for several years and he got it from another W8 call and he was the one who did the mods to this rig. It's had the audio mod done to it and you can connect to the carbon mic plug on the front. Several of my friends keep asking me if I've put the T3 on the air yet and I'm just taking my time to make sure every thing is going to go right ! . It's tuned up for 3.885 and the only thing now is the mic and it's done also .. last weeks question was getting the R390A to mute when the T3 was keyed up and that question has been answered so all there is to do now is JUST DO IT .. I know what ever breaks can be fixed but there's always that little doubt in my mind that something just isn't right and I have to over come that I guess. I love this old rig and my R390A and after looking at them for almost 2 years.. it's time to do it guess LOL .. thank you for all your input and others who have helped me in my quest to get this beast on the air.. so everyone be listening soon for WC4D to be on the AIR .. LOL .. thanks again

73 Don WC4D 1 more question and I'm done .. I have 2 fans mounted on a bar that will either blow air on to the 4-125's or pull air out .. anyone want to give me a suggestion push or pull .. I was thinking push the air in but another told me to pull the air out so the cold air doesn't hit the hot tubes ..

# 5963. Spark Gap spacing on the T-368 Filter Choke

Yahoo group: T-368_BC-610
Date: 2014-10-11 03:50:49 UTC
From: mac
Topic: 5963  Message: 5963

Group,

I'm a bit embarrassed to be asking this having been a T-368 owner for over 20 years but what is the specified spacing for the spark gap electrodes on the big HV filter choke (11H @ 500ma) in the power supply drawer? I can't find this information in any of the manuals or other tech information that I have. Same question for the spark gap on the modulation transformer.

Lost my big PS filter choke in the middle of a transmission about a week ago. Suspected the modulation transformer at first but quickly traced the problem (HV short to ground) back to the choke and found both terminals (isolated) reading 500 ohms to the case. No cracks in the insulators, leaks at the seals or anywhere else.. Got me to thinking about just what is the spark gap for? Never thought much about the PS in the T-368. Simple, straight forward design and the only trouble that seems to crop up in that drawer is with the relay in the primary circuit of the big power transformer. Looking at the schematic reveals a straightforward full-wave rectifier (pair of 3B28s or equivalent solid state substitutes) driving a choke input filter, 11 henry reactor with a total of 8 mfd worth of filter cap connected to the output side. So, note that the T-368 is keyed through the HV power supply, PTT energizes the main power relay in the primary of the HV transformer. PTT RELEASED and AC to the transformer and, likewise, the output from the rectifiers is interrupted. If this interruption occurs during a part of the AC cycle when the rectifiers are delivering current to the choke the magnetic flux in the core will collapse and the energy contained therein will manifest itself as a voltage spike the energy in which has to be dissipated somewhere. And this is exactly what the spark gap is (?) there for. This all happens down under the chassis where we can't see it but I would guess that an arc will occur here on at least half of all "key ups."

Or at least that's the way I suspect it all works. Thoughts? Also, don't know if too wide a gap caused the demise of my choke but probably best to err on the narrow side. Again, anybody got gap numbers?

If this interruption occurs during a part of the AC cycle when the rectifiers are delivering current to the choke the magnetic flux in the core will collapse and the energy contained therein will manifest itself as a voltage spike the energy in which has to be dissipated somewhere. And this is exactly what the spark gap is (?) there for. This all happens down under the chassis where we can't see it but I would guess that an arc will occur here on at least half of all "key ups."

Or at least that's the way I suspect it all works. Thoughts? Also, don't know if too wide a gap caused the demise of my choke but probably best to err on the narrow side. Again, anybody got gap numbers?

Joe,

Thanks, but only found a single reference there from you saying:

"Check all the spark gaps on the HV components, set
them according to the book."

In the meantime Ken has come up with a figure of .062" (measured).

OK, that's 1/16 of an inch and the gap on my (now defunct) choke measures in at just that.

**********

My name is Gerrit Jan Huijsman, callsign : PA0GJH, I am investigating a story about the Hallicrafters high power amateurradio transmitter HT-4. Perhaps you can help me or perhaps you know sombody who can., According to the story in the book The HT-4 goes to war by Will H.Connelly the owner of Hallicrafters, Bill Halligan was visited in august 1942 by an FBI-agent who demanded an HT-4. As there were none available and the production was stopped. Bill provided his own personal transmitter. It was shipped the same day to Hawai with a bomberaircraft, where it was used to inform the main land of USA on december 7th about the japanese attack on Pearl Harbor., The questions I have are:,
1. Why the hurry?,
2. Was there no other means of communications available?,
3. The HT-4 was installed on Hawai in august 1942. The attack took place on december 7th, where ther rumours about an oncomming attack?,

I am using the information fora n article in the Dutch Amateur Radio Magazine Elextron. The HT-4 was, as you probably know, modified into a military version called BC610 and was widespread used on battlefields during WOII as part of the mobile installation SCR-299. After the war the equipment became in use by the Netherlands army. Today several BC610’s are used by radioameurs in this country., I hope that you can give some information., 73, Gerrit Jan, PA0GJH

Either he or the book or both are off by a year. The Marines landed on Guadalcanal on 7 August 1942.

However, although I can't tell you the model numbers other than as a guess, the Navy, the Army and either RCA or Press Wireless or both all had transmitters on Oahu capable of more or less continuous contact with the US mainland. So it's a BS story.

Hi Robert,

The original poster from Holland got it wrong, the book clearly starts out in August 1941 with an FBI "G-Man" coming to the Hallicrafters factory. What it doesn't give is the secret destination that Halligan's HT-4 was actually shipped to, as the book was published during the war. So, the reference to Pearl Harbor comes from elsewhere.

hello , well , i have read up a lot about pearl harbour. what i read was that the HT4 was there merely for evaluation and in use as a standby. however the raid took out the main radio station's power supply. for a short while the HT4 was the only means of communication , and the news of the attack was relayed on it. this led to the HT4 being looked on favourably by the military and resulted in the BC610.

Morning Alan,

Trust you're well. That story makes a lot of sense and the HT-4 could operate from domestic supplies or a portable generator whereas its likely the main radio station would be on the grid with back-up gennies?

There has been a lot written about Pearl Harbor, hasn't there? I understand that Yamamoto looked closely at Italian reports on the Swordfish raid on Taranto and gained some useful ideas from it. Of course, his aircraft were more modern than the "Stringbag"!

Off the air at the moment pending the shack being refitted with some winter heating in the form of a woodburner stove but hope to be QRV again before Xmas. See you on 3615.

Hi All,

A fellow BC-610 owner over here has asked me for some advice on using an external VFO with the BC-610, in his case he has built a DDS from a kit and is having problems getting it to drive the TX. The kit is here:-

GW4GTE http://www.shortwaveradio.co.uk/multi-rock%20II.htm

http://www.shortwaveradio.co.uk/multi-rock%20II.htm

GW4GTE http://www.shortwaveradio.co.uk/multi-rock%20II.htm [site home] [projects home] [ordering info] Download Rev 1.1b of the full manual [here] (July 2012) Multi-Rock II is a DDS controlled freq...

View on www.shortwaveradio... http://www.shortwaveradio.co.uk/multi-rock%20II.htm
Preview by Yahoo

I see it generates 600mV of sine wave and I'm pretty sure that is far too low to drive straight via the xtal socket. My advice to him has been to speak to the kit maker, as GW4GTE is a keen vintage equipment user and has no doubt had this issue before, although maybe not with a '610, so I thought it worth asking here.

What do other owners use? Any ideas on extra stages to boost the RF from the DDS? Any mods needed to the Tuning Units? The DDS shown can generate half or quarter carrier frequency, would it be better to stick to BC-610 protocol and multiply as per the tuning charts or go straight in at carrier frequency? I'm guessing multiply as per crystal operation.

Thanks,

Roger/G3VKM - Norfolk, England.

The WA1FFL VDFO amp is the perfect thing for this. I have built one and its works fantastically. He has some bare PCB's if you don't want to design your own board and they are much cheaper than having your own made. I believe he also has a kit with the Torrodial cores included to make it even easier.

David & Tom,

Many thanks for the fast response. The DDS kit designer has recommended a step-up transformer but I still think that drive will be lacking. David, do you use your WA1FFL board with a BC-610 and if so, do you just feed the oscillator valve grid via the crystal socket without any mods to the tuning unit? I think the person who has asked for me help will want to retain the facility just to swap easily between external VFO and crystals.

I'll have a good read of the WA1FFL article and maybe come back with some more questions.

Thanks

Roger/G3VKM

Roger, I do plan to use it with a BC-610, and have tested it into a dummy load, but not on the air as of yet. I do just feed the crystal socket. Currently I have it attached to a Johnson Valliant, same way into the crystal socket and it provides plenty of drive, it does on the 610 as well. WA1FFL's little amp is broad band and so there is nothing to adjust when changing bands which is great with me. Have not figured out a way of switching the tuning units other than moving the cable to the crystal socket manually, but I am thinking about a switch in the DDS unit, and then 2 cables as I only put the 610 on 80 and 40.

Subject: Re: [T-368_BC-610] DDS with BC-610

David & Tom,

Many thanks for the fast response. The DDS kit designer has recommended a step-up transformer but I still think that drive will be lacking. David, do you use your WA1FFL board with a BC-610 and if so, do you just feed the oscillator valve grid via the crystal socket without any mods to the tuning unit? I think the person who has asked for me help will want to retain the facility just to swap easily between external VFO and crystals.

I'll have a good read of the WA1FFL article and maybe come back with some more questions.

Thanks

Roger/G3VKM

OK guys, lot of commentary, thanks.

First off, though, the 1942 date looks to me like a typo on the part of PA0GHJ. Can't imagine any author writing in 1944 (book pub date) stating that a radio shipped to Hawaii in 42 could then being used to announce an attack that took place in 41.

Next, there were of course multiple means of communication between Hawaii and the mainland in 41. I remember reading someplace that a commercial cable connection between the US and Japan was kept open all during WW2 but no traffic was passed during that period.

The FBI making off with Bill's personal HT-4??? If so would likely have been in 41 (see above). Never heard that story but remember something about Bills radio being acquired by someone. The Army maybe? Anyone know more?

# 5985. HT-4B For Sale

Yahoo group: T-368_BC-610
Date: 2014-10-23 19:30:42 UTC
From: Barrie - Yellowstone Photo
Topic: 5984  Message: 5985

Speaking of HT4s, I have a very nice HT-4B that I wish to sell due to poor health.

I bought it about 30 years ago. The initial owner bought it prior to WW2, then, shortly thereafter, went to war and never came back.
It was stored in the family business (an auto repair shop) under a tarp for all those years until a friend told me about it.
I wasted mo time buying it.

I had it on the air on 20, 40, 80 and 160M many, many times of many years. It has always worked well with full output+.

I have a considerable number of spare TUs and both 250TH finals and 100TH modulators in stock here. All have
been tested and produce full power. I also have a spare modulation transformer.

The BC-614 quit working a few years ago. With my eyesight such as it is now, I made no attempt to repair it. Instead,
I'm using an ancient (but nice) audio amplifier with a pair of 807s, no less!
I've been told it sounds great.

If anyone is interested, or has questions, please email me.

73, Barrie, W7ALW since 1950

Scott,

I still have a few of the original male and female octal plugs, NOS, $15 each. I have some cordage that would work at least electrically, but mechanically it is a little larger. The original cordage was 8-conductor shielded, and probably a mix of #16 or #18 and #20 or #22. With about a 1/2" OD. What I have is WM-46/U, 10 #18 AWG shielded, with a 5/8" OD, $2/ft. The original CD-764 is 8'-0" long..

# 5989. Antenna changeover relay bad?

Yahoo group: T-368_BC-610
Date: 2014-11-15 05:28:10 UTC
From: Chris Farley
Topic: 5989  Message: 5989

I have a suspicion that the vacuum antenna changeover relay may have failed and arced over in my T-3.  I can't see any obvious pitting in the electrodes, but the glass seems a little on the uneven, foggy side.  Like a layer of crud, but either inside, or on the inside of the glass.  Does yours appear the same way, or are they crystal clear?  If the latter, does anybody have a spare?  The 80 meter antenna transformer let the smoke out once, and I really don't want that to happen again...  Yes, I'm taking additional precautions to protect the receiver, but still.. If the relay is shot, it's shot.

Regards,
Chris

Scott,

I'm not certain, but if this is something off of the SCR-399-A or SCR-499-A equipment list, to work into the dynamic mic jack on the BC-614, you are looking for a T-50. AKA Electro-Voice 600C. I've only ever seen one of them and it went with my SCR-499-A when I sold it several years ago.

# 5995. BC-610I Help Needed, am stuck

Yahoo group: T-368_BC-610
Date: 2014-11-30 04:25:42 UTC
From: Dave Trainor
Topic: 5995  Message: 5995

Guys, I have a BC-610 I that I restored some months ago, had it working perfectly into a dummy load in the back room of the house. It sat there for most of the summer and I disassembled it to move it to the ham shack. (detached 2nd floor garage – why it got disassembled to move up the steps) Reassembled it and now I have a major problem.

Here is what is happening - filament power comes on fine, not as much adjustment in voltage as I remember, but it starts at just slightly below 5v – the antenna shorting relay is humming 92v AC across the terminals, I don't remember that before I move it and reassembled, turn on exciter plate power and the exciter VR tubes light and I can tune the exciter normally and it puts out plenty of drive. Now the problem, I turn on plate power and the 6A FS4 blows, so I did not have any more 6A fuses on hand, so I replaced it with a 15A I had (bad idea I know), it no longer blows, however no plate power, the plate contactor RY1 has 18-20V across the coil when plate power is on, and seems to have 18V with plate power off. The antenna shorting relay seems to be in the current path, I thought the relay was bad, shorting the terminals on the antenna shorting relay does have an effect, the plate contactor RY1 will oscillate on-off, only tried that for a couple seconds.
Have traced out all of the connections on the inter-deck cables, I had labeled each one when restoring, all are correct, checked over 5 times now and after sleeping on it again. Checked to make sure that terminal 7 on TS11 (mod deck) is the cold side of the 117v input.

The unit is wired according to the schematic in the TM 11-826 Figure 81 which I printed on a plotter at work for the restoration, 3' x 6' so I could easily follow it and highlight each connection.
I had a note on my large format schematic from the restoration some months ago that circles terminals 5 and 6 on TS3 (this is the plate contactor RY1 coil connecting points) the note says revered 117V polarity, so I swapped them 5 to 6 and 6 to 5, symptoms are identical so put them back per the schematic.

I am out of ideas after studying the schematic most of last night and today. Everything is wired correctly. I can't seem to figure out where the voltage across the antenna shorting relay is coming from. I believe it should be 0 volts until the plate power switch is turned on, and when the switch is turned on, it does not change. That is telling me something, that I am apparently too thick in the head to grasp.

Anyone have any ideas? Am beyond frustrated I can't make any sense out of the symptoms.

Please Help –

73 – Dave N8ZFM
Louisville, KY

# 5996. RE: BC-610I Help Needed, am stuck

From: Dave Trainor
Topic: 5995  Message: 5996

Thanks Steve, that is a good suggestion. In this case the big delay in moving the 610 out there was having the garage built. I planned on having the ham shack on the 2nd floor and so had a separate 200 amp service installed. From the garage breaker box there is a dedicated 30 amp 117v circuit with #10 to a dedicated outlet. Since I have so far been unable to get the plate relay to engage I can't measure the voltage drop, but believe it should be OK.

Dave,
Check your line voltage under load. Since it is in a detached garage, your run of romex might be too small AWG for the run length.

Hi all,

What is the matching range of the Pi-L network found in a T-368?  I'm in the process of building a link coupled tuner for 160, but it looks like my antenna has a highest impedance of about 750ish ohms (balanced) so I wonder if the transmitter might possibly be able to match this without an outboard coupler?

Regards,
Chris kc9ieq

While I don't know this for certain, try checking the time delay circuit. MOST equipment, of that era, with mercuryvapor rectifiers had one in series with the plate relay. In some cases it was a mechanical timer, in others something that looked like an octal tube.

  Thanks Steve, that is a good suggestion. In this case the big delay in moving the 610 out there was having the garage built. I planned on having the ham shack on the 2nd floor and so had a separate 200 amp service installed. From the garage breaker box there is a dedicated 30 amp 117v circuit with #10 to a dedicated outlet. Since I have so far been unable to get the plate relay to engage I can’t measure the voltage drop, but believe it should be OK.  73 – Dave N8ZFM  From: S Hobensack [mailto:shobensack@...]

Seven hundred fifty ohms on 160, no way. Also, the T-368 uses an unbalanced output. Recommend continuing on with your tuner project.

Dave,

Would recommend getting that 15Amp fuse out of the circuit before something melts or burns up. You should be seeing your full mains supply voltage (115 - 120 vac) across the coils of both RY-1 and the antenna shorting relay RY-4when energized but there should be no ac applied to the shorting relay until the transmitter is keyed. Looks like you have a problem somewhere in the AC circuitry fed and protected by FS4. This would include the the filament supply in which you noted an adjustment difference (T3) and also the power supply of which T2 is a part.. Also feeds T1 and T10 through FS5 but since that fuse has not blown the problem is probably not in that area.

The circuit diagram you have is difficult to use for the kind of troubleshooting required here. The circuits fed by FS-4 are scattered across different chassis in the BC-610 and are difficult to trace out with the kind of presentation found in Fig. 81 in TM 11-826. A much better presentation for troubleshooting purposes can be found in TM 11-281 Figure 120. Unfortunately no equivalent is provided in TM 11-826 (I checked).

# 6002. RE: [T-368_BC-610] BC-610I Help Needed, am stuck

Yahoo group: T-368_BC-610
Date: 2014-12-01 04:20:07 UTC
From: Dave Trainor
Topic: 5995  Message: 6002

Thank you very much Dennis. I agree with everything, And I really appreciate the post, I am a ham but work as an IT engineer so working on this is a hobby and my knowledge level in radio electronics is what I would call enough to be dangerous. Love doing it but my skill in troubleshooting could do with some improvement. I would almost be happier if something had gone up in smoke, finding a replacement might be a lot of fun, but at least I would know what to fix ☺

it is difficult to trace with the schematic because of fact that its scattered across all 3 decks, lots of long crisscrossing lines. I thought the ant relay should be at 0 unless plate power is on, thanks for confirming that.

Am waiting on mouser and more 6A fuses. Should be here before the end
of the week.

I suspect T2, mostly because the original was bad and I had to use the one from the incomplete donor 610 I got with this one. Luckily it was functional and present. I believe that the original had a HV insulation problem. I had this operating a few months ago so I know the donor T2 was good at that time, and really should not have gone bad sitting for 6mo.

So if I lift term 7 on TS14 that feeds terminal 2 on T2 the ant relay drops But still no voltage across RY1 when operating the plate power switch.
If I check for voltage on TS11, terminals 6 to 12, I am switching the 120v ac with the plate power switch, so the switch itself is good.

Not quite sure how to verify T2 is not the issue because I am not sure what the relay RY2 is switching with terminal 3 from T2. Searching as to where the voltage on the ant relay is coming from.

Mostly that’s because I do not grasp the overload trip circuit or where the “other” side of the ac mains is vs TS3 terminal 6 which is hooked to the physical plate power switch and traced to one side of the coil of RY1, the other side loops thru the ant relay and then back thru RY2 contacts to T2 terminal 3, I don’t see where it would have 120v across it at all.

If I check from the plate power switch (12 on TS11) to the relay contact on RY2 that’s attached to T2 term 3, should I have 120v ac that’s switchable on/off via the plate power switch?

T2 is the filament transformer for the HV rectifier tubes (866s early, 3B28s later). RY 2 is the "overload reset relay" and when NOT activated one of it's contact sets feeds ac to the coil of RY1. When activated by an overload, ac to RY1 is cut off along with HV for the xmtr's PA (and ac to the antenna relay). The "overload" relay BTW senses the current being drawn from the HV supply and when tripped then energizes the "overload reset relay" which has a set of contacts that then keep it energized until the "overload reset" switch is activated. The coil of the "overload relay" is connected in series with the negative side of the HV supply to ground and was specially designed to pull in at some current level above the normal operating value (TM doesn't give a figure).

> Searching as to where the voltage on the ant relay is coming from.
>
>
>
The coil on the antenna relay is electrically connected directly across the coil of RY1, the plate power relay, i.e. RY1 energizes the antenna relay also energizes.

Probably a good idea to check T2. Does carry the HV when in operation.

The BC-610 does label one side of the AC power coming into it as "A-C Common" but it's floating and fuses can be found in either side of the line one circuit to another . In the Filament Voltage control circuits (Fig. 77, Page 122, TM 11-281) for ex. FS2 and FS4 appear in what I would take to be the Common side of the line and FS1 is placed in the Hot(?) side.

If I check from the plate power switch (12 on TS11) to the relay contact on RY2 that's attached to T2 term 3, should I have 120v ac that's switchable on/off via the plate power switch?

Yes -- from what I see in my schematics and everything is connected up and working right.

Figure 45 in TM 11-826 might be helpful? It shows the control ccts and their interaction points with other chassis.

Does the BC-610-I have a rear cover interlock? I can only see two on that diagram and the BC-610-E has three, two on the top cover and one on the back. I had issues with the back interlock not closing properly all the time.

From: Roger@...
Topic: 6005  Message: 6005

Hi All,

Would be interested to hear from the group about how folks are switching between RX and TX when using an external VFO with their '610s, whether a vintage VFO or a modern DDS type. Obviously, you don't want the VFO running on receive if you're working simplex.

TIA,

Roger/G3VKM - Norfolk, England.

Roger, yes the I model has 3 interlocks, I have the back panel one jumpered at the moment so I can troubleshoot. There are two more on the top cover doors. All have continuity, that was the very first thing I checked.
As soon as I get more of the 6A fuses I will go back to tracing.

Thanks,
Dave Trainor - N8ZFM

Thanks Alan,

I have just been repairing one of those MR2s for James, GU6GCI, he was having trouble getting a signal out of it. It looks as though it was a simple solder bridge and a duff 5V regulator. At 600mv output it's too unpowered to drive a BC-610 barefoot but James had bought a couple of the buffer amps for vintage rigs, made by Hagerty Radio. They boost the MR2 to 8-9 volts and I was able to drive the '610 OK via the crystal socket on the TU, although I could only get about half normal RF output from the PA on 80 metres, so it's still lacking enough uumph! I have a nice ET4336 VFO here, that has an 807 in it, bet that will do the job.

I'd noticed that the MR2 has a T/R switch but was wondering how people were interfacing their VFOs to the '610, maybe connecting to the remote keying line, or something? Probably easier with a VF-1 or a HG-10B, etc as they are similar technology, but a lot of people seem to be going over to digital VFOs.

Cheers,

Roger/G3VKM

Dennis one thing comes to mind – the original cord is a 2 prong AC cord, no ground wire with as you point out both sides of the AC circuit floating. What effect do you think there is of having a new 3 wire cord, with the neutral or common connection also connected to ground? I have verified that I have the black or hot AC side going to the correct side of things, and the white or neutral line is connected to AC common.

But I now have a 3 wire cord connected with the green ground connected to the chassis directly on the mod deck where the socket is for the ac cord, I used a new socket with 3 pins replacing the original ac socket. As is normal now the ground wire is directly connected to the common side in the breaker box. So in reality the common side of the AC line is also grounded. In my restoration I probably did not have the unit grounded at all since the dummy load was just sitting there on the floor so it was also isolated from ground.

This is possible, because someone replaced the 2 prong outlets in my home to 3 prong without connecting the ground pin, guess they did not like 3 prong adaptors, when I had it in the house it may not have been grounded at all. The home is old enough it has 2 wire romex and no 3rd ground wire. My new garage/ham shack is up to 2014 code so the 3rd prong is a real ground.

Guess I could disconnect ground and see – but the RF ground bar I have in the new shack is to a ground rod, and the breaker box also connects ground to the ground rod, so if ground should not be equal to ac common as soon as I connect a ground lead I will be back in the same place electrically.

I took Alan’s idea and ordered some breakers to replace the fuses, if I am going to pop them during troubleshooting it will be a lot easier, and while not authentic exactly, I am more concerned with getting it back to fully operational and actually using it. I can see myself becoming a major customer for glass fuses here.

Thanks - 73
Dave - N8ZFM

Not quite sure how to verify T2 is not the issue because I am not sure what the relay RY2 is switching with terminal 3 from T2.

T2 is the filament transformer for the HV rectifier tubes (866s early, 3B28s later). RY 2 is the "overload reset relay” and when NOT activated one of it’s contact sets feeds ac to the coil of RY1. When activated by an overload, ac to RY1 is cut off along with HV for the xmtr’s PA (and ac to the antenna relay). The “overload” relay BTW senses the current being drawn from the HV supply and when tripped then energizes the “overload reset relay” which has a set of contacts that then keep it energized until the "overload reset" switch is activated. The coil of the “overload relay” is connected in series with the negative side of the HV supply to ground and was specially designed to pull in at some current level above the normal operating value (TM doesn’t give a figure).

Searching as to where the voltage on the ant relay is coming from.

The coil on the antenna relay is electrically connected directly across the coil of RY1, the plate power relay, i.e. RY1 energizes the antenna relay also energizes.

Probably a good idea to check T2. Does carry the HV when in operation.
The BC-610 does label one side of the AC power coming into it as "A-C Common” but it’s floating and fuses can be found in either side of the line one circuit to another . In the Filament Voltage control circuits (Fig. 77, Page 122, TM 11-281) for ex. FS2 and FS4 appear in what I would take to be the Common side of the line and FS1 is placed in the Hot(?) side.

If I check from the plate power switch (12 on TS11) to the relay contact on RY2 that’s attached to T2 term 3, should I have 120v ac that’s switchable on/off via the plate power switch?
Yes -- from what I see in my schematics and everything is connected up and working right.

That you Roger, I have one of the Hagerty VFO DDS kits and the buffer amp, have not used it yet on the 610 due to another ongoing problem but I planned to use it into the crystal socket. Its good to know it will drive the 610. Once I get the present trouble sorted out using this will be the next step. My testing so far has been with the tunable MO in the TU, but I know that will drift all over the place. DDS is for sure not 1940's but we do need to be stable nowadays unless I was just going to look at it like a museum and not really operate it.

Hi Dave,

I'm not sure of the output of the Hagerty DDS but the 8-10 volts I was getting from the MultiRock and Hagerty buffer combo was not quite enough to drive the '610 to full power, possibly the Hagerty DDS is more powerful?

In practice, I've not found that I need many frequencies as AM operation over here is mainly on 80 metres, 3615 and 3705 are the main channels, with 3575 and 3577 for CW, so a few crystals do the job. I bought some of the tiny wire-in rocks from Bryn, AF4K, and they work OK mounted inside a gutted FT-171 holder. They won't work with some other TXs, like the BC-669, however.

Joe, Yes it is firmly attached. My mains voltage runs an average of 122v, with a low of 120 and have also measured it as much as 125. So like most I have a higher than 115V in the specifications.

I am waiting on more fuses, to continue, but am going to try un-gounding and see what happens since the original was both sides of the AC floating and that's not the case anymore as the common side and ground as both tied together at the breaker box, and the breaker box firmly tied to the ground rods which also attach to the antenna ground at the base of the tower, I have several ground rods and they are all tied together with thick 2" tinned braid. The next problem is this fixes the issue I am seeing, is what to do about it. Maybe an isolation transformer but it would have to be a hefty one. Figure that part out if I have to.

<T-368_BC-610@yahoogroups.com<mailto:T-368_BC-610@yahoogroups.com>> wrote (in part):

Not quite sure how to verify T2 is not the issue because I am not sure what the relay RY2 is switching with terminal 3 from T2.
T2 is the filament transformer for the HV rectifier tubes (866s early, 3B28s later). RY 2 is the "overload reset relay” and when NOT activated one of it’s contact sets feeds ac to the coil of RY1 from the 117 volt tap on T2 (term 3). When activated by an overload, ac to RY1 is cut off along with HV for the xmtr’s PA (and ac to the antenna relay). The “overload” relay BTW senses the current being drawn from the HV supply and when tripped then energizes the “overload reset relay” which has a set of contacts that then keep it energized until the "overload reset" switch is activated. The coil of the “overload relay” is connected in series with the negative side of the HV supply to ground and was specially designed to pull in at some current level above the normal operating value (TM doesn’t give a figure).

Searching as to where the voltage on the ant relay is coming from.

The coil on the antenna relay is electrically connected directly across the coil of RY1, the plate power relay, i.e. when RY1 energizes the antenna relay also energizes.

Probably a good idea to check T2. Does carry the HV when in operation.
The BC-610 does label one side of the AC power coming into it as "A-C Common” but it’s floating and fuses can be found in either side of the line one circuit to another . In the Filament Voltage control circuits (Fig. 77, Page 122, TM 11-281) for ex. FS2 and FS4 appear in what I would take to be the Common side of the line and FS1 is placed in the Hot(?)

side.

If I check from the plate power switch (12 on TS11) to the relay contact on RY2 that’s attached to T2 term 3, should I have 120v ac that’s switchable on/off via the plate power switch?
Yes -- from what I see in my schematics and everything is connected up and working right.

Dave,

Do you have such things as "site transformers" over there? In the EC and UK power tools for use outside by professional users are supposed to be 100-110v and this is derived from a site transformer with a 230V primary and a 50-0-50 secondary, with the centre tap grounded. The logic is that the maximum shock exposure from the power tool metalwork in the event of a fault is 50Vish WRT to ground. I use a site transformer, with the centre tap disconnected, to power my BC-610 and other US equipment that has 115V primaries from our 230-250V domestic mains. It occurred to me there might be isolation transformers providing 115V in to 100-115V out over there?.

A lot of 230/115V transformers available here are autotransformers, they have a single winding where the output can rise to 230V when the equipment is off. The "site" option was probably cheaper than a special 230/115 transformer and it is totally enclosed with dedicated connectors.

Just a thought,

73

Roger/G3VKM

Well this no longer is a worry as I tried lifting ground last night and that had no effect, I still have voltage on the antenna relay with plate power off. So back to tracing and trying to figure out where the issue is. Glad in a way its not the ground as that would be a difficult issue to solve.

We do have site transformers here in the US but the ones I have seen are to convert from the 480v 3 phase current supplied to a lot of businesses and data centers to 240v, I have one of those in my data center, they are not cheap by any means. I did not know you all in the UK used anything on 110V, that’s interesting.

Ooook, then,
It's time to check and verify that everything is what it is supposed to be,... or what you think it should be. There is no telling what someone did some where along the line, both in the house wiring and in the transmitter.
Also, check the voltage under load, long shot, I know, but we're looking for something you haven't found yet, that could get interesting.

I would have myself to blame for both. Not the house, but the new ham shack was wired by me, inspected of course, but KY allows the homeowner to do their own. The inspector did comment on why I would need such a large service to a garage – so I showed him the collection of radio equipment.

On the 610 – the original was in very sad shape, so I gutted it, had the chassis and cabinet dipped to remove rust, power coated, and then re-labeled everything per the pictures. The original wiring had been eaten into by rodents, it looked like, so that all got trashed and I made new wiring harnesses per the diagrams in the manuals. This took a long time. Each wire was labeled with a brother tape label with the connection number (per the manual) and then a clear heat shrink over it before soldering the spade connector on. Again this took a long time. And I did make a couple mistakes along the way that I had to fix. The result is not original at all, but it does look like new, I had to carefully remove the power coating at mounting screws and ground points. The harness is exactly what the manuals show, cable laced exactly the same (but with tie wraps, I used the correct specified gage wire but I could not get correct colors so used the labels).

However I had it working correctly in the back bedroom of the house about 9mo ago, put out a full 250W into a dummy load, plate on the 250TH glows a nice cherry red, I was quite happy. I also somewhat tested phone operation but I had not finished the 614 at that time. It was operating perfectly in CW mode. And so I left it sit there after spring came and I started work on the new Garage and 2nd floor ham shack.

Its way to heavy for me to move, so I disassembled the sheet metal, removed the connecting harneses and pulled out the decks, moved each one up – the power supply deck is still way too heavy but I got it up there. Re-assembled. And then turned it on for testing before I put the sides back on.

That’s when I discovered this problem – so what did I change (what changed is the mantra of an IT guy) – I removed the inter deck harnesses – check each wire, numbers match, repeat this step multiple times, blow some fuses, then ask for help here as I can’t find a dog gone thing. Something other than the inter deck harnesses must have gone bad while it was sitting, that’s hard to believe, much more likely I have a wire crossed, hence the check so many times on wire numbers against the diagrams and checking continuity.

Mostly all of the parts are original, I simply cleaned them and replaced in the chassis, new light bulbs, but almost all of the parts are original, I had to replace the filament rheostat as the original was cracked, but amazingly enough Ohmite still makes the same part, exactly, at a steep price but its still in production. Oil caps stayed, some small carbon resistors out of spec are new, and some small caps replaced with orange drops, mica’s were all still good.

If this was when I first assembled it, after making all new wiring harnesses, I would be 100% that I had made a mistake. But it worked fine, until I left it sitting and then moved it, the moving was careful and I have inspected for anything that I might have pulled loose or bent (etc) in the move, nothing. But I will find it, I have way too many hours and $$

invested to simply give up.

So why – the very first ham radio set I saw was a 610 that my father's friend, who had operated the 610 during the war with 3rd army (both him and my dad were in a forward observer team). My father was the medic. Anyway at that young age it was the coolest thing I ever saw, he was mostly a CW guy. Both are now SK's but I have always remembered the 610 and I came across this one in very sad shape and decided to restore it as it brought back being a kid and being in awe of a real CW op. So yeah I could have found one in better shape and spent a whole lot less, but then again I KNOW the circuitry a lot better, and it was fun. What the hobby's all about.

The T-368 has a large 2000pf 5kV mica bypass capacitor from B+ to ground near the plate current meter.  Mine has leaked out some of it's goo in the past, but seems to be doing fine now.  What could the smallest permissible value for this cap be?  Wouldn't a 1000pf or even 500pf ceramic suffice?  Even smaller?

Ref T-368 (2000 pfd 5KV Mica Capacitor.
Have you a picture of this capacitor. If it is the solid brown/dark brown Mica caps that I'm familiar with, then I don't recall replacing one in the military Transmitters that I worked on including the BC-610 & the T-368. I worked on several models including the the C,D, and E. I had a nice T-368C which I sold back to the to my friend and previous owner.

It's one of the old F2B series Sangamo transmitting capacitors, about 1" x 3" x 2" with a pair of 10-32 studs.  It mounts on the left hand side of the RF deck, right next to the loading control.
This thing is just being used as a bypass cap though, so it wouldn't seem like it has to be quite this beefy. As mentioned before it has physically leaked sometime in the past, and I might as well replace it with something of the lowest capacitance value possible to try and lower the total shunt capacity in the RF deck.  I'm thinking a 500pf doorknob would work just fine, but I could be overlooking something obvious here- thus the inquiry.

Regards,
Chris

  Ref T-368 (2000 pfd 5KV Mica Capacitor.Have you a picture of this capacitor.  If it is the solid brown/dark brown Mica caps that I'm familiar with, then I don't recall replacing one in the military Transmitters that I worked on including the BC-610 & the T-368.  I worked on several models including the the C,D, and E.  I had a nice T-368C which I sold back to the to my friend and previous owner.  73,Glen Galati, Tacoma, WA. 253-272-1061

A doorknob in that location will look like a total kluge. The purpose of the capacitor is to keep RF out of the meter. Unless you have a drawer full of NOS replacement meters, I would replace it with one just like it except a good one. "lower the total shunt capacity in the RF deck" does not compute.

Actually I can visualize a way to mount a doorknob there that would look just fine, although a replacement mica of the same form factor would obviously be the most convenient, lower capacitance or not.  But I digress..
The point of lowering the PA deck B+ shunt capacity would be to help increase the high frequency audio response.  C5, the 4-400a screen grid bypass, has been changed from 2200pf to 400pf and made a HUGE difference.  No ill effects have been seen on any band.

Cold, and loaded on 80, I measure about 4000pf from the 4-400A anode to ground.  This seems like a lot, and would explain why the high frequency response suffers so.

That being said-  I'm NOT trying to make a 12kc wide broadcast transmitter out of this thing, just trying to brighten it up a bit and get away from that typical muddy military audio.  (Not that there's anything wrong with that!)

CHRIS,

The T-368 in it’s original configuration has about 8000pf effectively shunted AUDIOWISE across the secondary of the modulation transformer, as a consequence of the 4000pf of coupling capacity between the two sections of the pi-L tank circuit, 2000pf bypass cap on the incoming line and the plate tuning (300pf) and loading (1500pf) capacitors.. This causes a definite drop-off in the frequency response of the radio at the upper end of the audio frequency range. A significant improvement in audio response can be obtained by reducing the coupling capacity in the Pi-L circuit to 1000pf. This changes the tuning settings on 160M somewhat but with no other adverse effects (except that the radio may no laongerwork all the way down to 1500 kc). Reducing the capacity of the HV bypass cap as you are proposing WILL also help course. Reducing the screen bypass capacity as you have done sounds interesting (I’ll have to try that). On the use of doorknobs in place of the original large micas, that would be electrically all OK. Guess I never worried that much about appearance issues inside the cabinet.

I left my T-368C in stock configuration (aside from dialing back the clipper setting), and added some EQ in the audio input external to the radio. I get excellent signal reports, and my radio is in its original, correct configuration rather than being hacked up.

There's a difference between hacking, and fine tuning for better performance.  I like things stock and unmolested too, but these things are way too choked down in their original configuration.  Instead of running it absolutely 100% bone stock original, I'm swapping the bias ply's for radials, advancing the base timing, and popping in some halogen headlamps.  And maybe even a pair of fuzzy dice.  I'm not ripping out the slant 6 and installing a 440 six pack, pulling off the column shifter and putting a 4 on the floor, nor flaring out the fenders and painting flames on hood.  Every change being made is easily 100% reversible, and will be documented.

If I were going to "hack" this thing up, I would gut the whole speech amp, change the modulators to something beefier, and shunt feed the final to completely eliminate the excessive PA  shunt capacity issue.  The goal is to get this transmitter sounding as good as possible withOUT external processing, yet not go completely nuts with mods.

Oh regarding that 400pf screen bypass-  It's worth mentioning that the screen voltage is now being modulated along with the plate of the 4-400, by virtue of sliding the grid lead over to the modulated B+ connection on the rear of the RF deck.  If you aren't already doing that, I'm not sure how much (if any) the value of C5 would matter.

As for the value of C10...
Using the formula Fc = 1/(2*pi*sqrt(LC)) only looking at the circuit of C10 and L3, the current 2000pf and 1mF combination make for a LPF cutoff frequency of 112kHz.  This is obviously low enough to keep any meaningful level of RF from getting back into the meter or B+ line.  Lowering C10 to 1000pf raises the cutoff freq to 159kHz.  500pf raises it to 225kHz.  If someone can double check me here I would appreciate it, but it would seem that even a 500pf cap in location C10 would have no problem keeping RF out of the meter.

Now at face value, even leaving the 2000pf cap would not affect audio frequencies.  BUT- the entire B+ path in the RF deck essentially forms a multi pole Butterworth low pass filter!  It will be interesting to calculate the cutoff frequency for the entire RF deck, from C10 to the 4-400a.

Side note:  I now see that L3 is 1mH only on T-368 suffix A,B,C.  On the E schematic L3 is changed to 70uH, and new part L13 (1mH) is added on the meter side of C10.  Weird.

Fun stuff, but it's past my bedtime.

Regards,
Chris kc9ieq

Hi Perry,

Many thanks, I have made up a adaptor using an unwanted FT-171B crystal unit, with the crystal and contacts inside removed and a BNC socket fitted to the metal label. Understood about the relay, I was wondering if people are using a sequence of relays, with the VFO power coming on first followed by the BC-610 power?

73 and HNY,

Roger/G3VKM

Hello Group
i am using now for 3 years a dds with the bc610-e and bc610-G with manny fun.
but this year i want to run my t-368 a little more
my question is now
are there people running a t-368 with a dds on the excitation input to the vfo .
i think there is somwhere a schedule for using a ext vfo but i can not find it now
you must change some cable in the deck (i think)
happy new year for you al and have a lot of fun with this nice stuff

Chris, Jan,

I guess one could disconnect the PTO on the T-368's exciter chassis and feed the exciter chain with an alternate signal source. But why would one want do that? The internal Collins PTO in the T-368 is VERY stable and well behaved, unlike the MO option on the BC-610 tuning units.

The PTO in mine is actually quite drifty. Even after a several hour warmup, she drifts between 100-500hz/hr depending on band.  The transmitter is a TRW "F" model, although I just realized my oscillator deck looks to be made by B&W, with a triple digit s/n on the Cosmos PTO.  Fair to assume this waa replaced at some point, with a much older assembly?

I really don't want to tear the PTO apart, but might not have a choice...

The PTO in my T-368 is quite drifty, it increases in frequency as it warms up.
Tubes have been replaced, same thing.
Probably takes an hour to settle down.
Too long for me
I run a home brew DDS vfo in place of the PTO and it is rock solid.
I would be willing to bet that if you put a frequency counter on the output of ANY
T-3 PTO, you would see it drift over time, some worse than others.
Just the nature of the beast.

Topic: 6005  Message: 6046

I don’t think it should be necessary to move internal cables to use an external VFO. For CW, I believe that you can simply set the service selector switch to EXT EXC and then inject the desired carrier frequency at the EXT EXC front panel connector. But if you want to transmit AM, then you would instead need to set the service selector switch to FSK-AM and then apply the VFO at the FSK front-panel connector. In the latter case, you are injecting into the multiplier instead of the VFO, so you need to inject the appropriate divided-down frequency. Also, in this mode the EXT EXC connector will be an output from the MO instead of an input to the PA.

If that’s too confusing, I can try re-explaining it… :)

I haven’t tried using an external VFO yet, but it’s on my to-do list. I’m also thinking of seeing if I can slap a vernier drive on the MO tuning knob without making any permanent mods to make it easier to zero-beat accurately.

Thank You Dennis/Chris/Don/Mark for the reply
First of course the mo of the bc610 is for normal use for amateur not so good .
The PTO of the t368 is musch better and in some transmitters stable (i think)
i have a external dds and i want it to use it with the t368 (mine is also drifty)
Here in europe we have not so many space on the band and some people dont like AM.
Therefore i want to have a stable signal on the t368
I know now that you can connect the t368 on 2 ways
A internal connections for general use
B internal connections for use with radio modulater md-239
i have the md-239 but dont use it and the internal connections is for general use (ext exc on j104)
For Don :::
can you tell us how dit you do it with the dds to the MO?
Thanks
PA3HCO

# 6048. T-3 manufacturers ?

Hello all:First post. I am the owner of a T-368 exciter/vfo. I was sent some info by Bob NT8W, on a PP 250TH HB transmitter that was built by Joe Bratcher W4RTC  & Bill Decker N4VMY (SK). Included with the info was a large format schematic of the T-3 RF deck. Below the schematic it says: "Figure 73. Am Transmitter, RF deck schematic diagram". To the bottom right of the schematic it is printed TM4000-27. I have downloaded the depot maintenance manual on the T-3 from the BAMA site, TM 11-809-35. Figure 73 in that TM is not the same. This is no big deal, as I can use the one I have to do what I need. I was just curious about the different TMs out there... possibly different manufacturers over the lifetime of the T-3? Was there a primary contractor? On my T-3 exciter there are name plates for Veeder-Root & B&W. TNX, Mike, K4TQF

Mike,

Have no hard information on who designed the T-368 but may have been Barker and Williamson (B & W). Their nameplate appears on the earliest model, the "Basic" (and on some of the later ones as well). The model lineup was Basic, A, C, D, E & F. Detail changes and upgrades as production and model designations (A, C, D, etc.) progressed but all basically the same radio. Manufacturers included B & W, Bendix, Crosley, Stomberg Carlson, Oneida, TRW and Daystrom and there may have been others. What differences are you noting between the two "Figure 73" versions you have. The model letter should be included on each schematic. The Depot maintenance manual you downloaded should have covered all but perhaps the latest models (E & F). Veeder-Root probably manufactured the mechanical frequency read-out on your exciter.

Dennis:
Yes, I figured  Veeder-Root was a sub-contractor for B&W.
As far as the diagrams... totally different ballpark. A comparable diagram in the BAMA TM 11-809-35, is Fig. 100. The schematics are spread out over several pages in the .PDF. I haven't done a side by side parts comparison. I just found it odd that the TMs would be laid out differently. They probably contain the same basic info...

Mike,

The reference is to TM 11-4000, Trouble Shooting and Repair of Radio Equipment. Apparently the edition dated April 02, 1958 if it has a T-368 schematic in it.

The original single-volumn manual on the T-368/URT was TM 11-809 dtd 04/22/1955. In 1958, it was revised to add the -C model and split into three volumns, TM 11-809-10, -20 and -35. In 1961, the basic number was changed to TM 11-5820-258-... but the TM 11-809-10, -20 and -35 were not reissued (which was a little unusual). The only manuals printed with the "long number" format were TM 11-5820-258-20P and -35P. Plus several MWO's. A number of Changes were issued to the short number -10, -20 and -35 to add coverage of the -D and -E models.

B&W (Barker & Williamson) made your T-368. Veeder-Root made things like turns counters and dial mechanisms. So they were a sub-contractor. Several other contractors made one or two letter models but I don't have a list.

FWIW, T-3/FRT nomenclature was assigned, but the contract was canceled before it went into production. Somewhere around here I have it's proposed specs. I can't recall but think it was to be either 5 KW or 10 KW and cover 2-18 MC CW, AM and RATT.

Dennis,

You left out the T-368B/URT. It is covered in TM 11-809 Change 1. And by
TM 11-809-10, -20 & -35 as originally issued.

# 6055. BC-610 Questions

Yahoo group: T-368_BC-610
Date: 2015-01-13 05:31:59 UTC
From: mac
Topic: 6055  Message: 6055

Robert,

Any idea what the output impedance would be for a BC-610 with the
C-388A PA tank coil installed?
This is the 3.5 - 4.5 mHz coil with the FIXED link. Asking the
question in a different way just what value
of non-inductive resistance would one have to attach to the output
terminals to cause the radio to
deliver it's rated output to that resistive load.

Second question .. What kind of lead-in wire/cable/whatever was used
between the receiving whips
and the BC-342 and BC-312 receivers? I can find nothing on this in TM
11-280, -281 or -826.
Something that came pre-installed in the shelters maybe?

We're in the process of putting an SCR-499 together at Ft. MacArthur.

hello dennis, i have a complete and original SCR399 shelter . the leads are installed in it , and are thick rubber covered wire. there is no screening. sometimes when i am testing it in the shed with no antennas , you can receive quite well just on the leads. regarding the output impedance of the BC610 , it is 75 ohms. i use mine mainly with the BC938 coupler. this works very well into the correct whip or a wire of the length specified in the manual. it is not much good for anything else.
i have found that the original feeder with the correct length doublet works well, but using 50 ohm feeder does not. maybe experimenting with the length would improve things. the tank coil gets hot if you are not careful. alan G4GEN

Alan,

OK! Receiver antenna lead-ins came with the shelter and have a
thick, rubber covered format. Reasonable
to assume, then, that they would also have been pre-installed in the
CH-120-A chest in the case of the SCR-499.

And the output Z with the fixed link 75/80 meter coil is 75 ohms,
thank you very much for the information. We are
in the process of assembling an SCR-499 at the Fort MacArthur Museum
in San Pedro, CA. We will be
using a 200 ft. end fed wire antenna there so have constructed our own
custom designed coupler for that installation.

Thank you very much for the information. We have corresponded before.

Alan,

What is the OD of the receiver lead-ins? If it is approximately 0.350" and with a single conductor of #14AWG stranded? If so, then the cord is W-128. Which was used as standard antenna lead-in for all but one of the common vehicular sets.

Dennis,

I started to write last night that the output impedance was 72-75 ohms nominal because I recall once coming across the specs on the short piece of coax between the BC-610 and BC-939. Still haven't located it.

Robert/Dennis,

A BC-939 parts list I have here lists the coax thus:-

CABLE, RADIO FREQUENCY RG--34 A/U
(Authorized allowances will be a minimum of or a multiple of ft.)

According to various on-line data sheets, RG-34 A/U is 75 Ohm. Here in the UK I use 75 Ohm TV coax, seems to hold up OK, even on 400W. However, if anyone has a surplus length of the RG-34 I'd like to change my cable for the real McCoy.

Dennis, are you going to use a modified BC-939 for your 200ft wire or another type? I have an article by N6PY published in "ER" where he modified a BC-939 to tune a wider range of antennas.

HTH,

Roger/G3VKM

Hi Dennis & HNY for 2015 to you and all the group.

OK, I think the SPC has been copied by several commercial makers both in the Far East and here, so I will read up on it.

All well here; mostly just using the TCS station here but the '610 is ready to use when I can get it to tune into my 120' inverted L.

All the best,

Roger/G3VKM

Dennis,

If you manage to find a source of Wire W-128, I also need some. I was just about to buy another hundred or two feet from Willy Denninger when he had his stroke or heart attack. I haven't learned what finally happened to him. Or to the stock in his warehouse. I think he had another 500' spool of W-128, among a lot of other stuff.

Hi All,

Mentioned on the SCR-299 Group:-

Take a look at HB9EPC on QRZ.com. He has some great photos of the HO-17 shelter he has rebuilt.You'll have to scroll way down the page to find the relevant bit.

Well I do and I don't .. I am thinking now on just trying to find someone who has a great old AM radio and amp to trade for it. I don't want to sell it out right because knowing how I am I'll spend the money before I get something to replace it with. But I have no idea on just what would be a good trade for it.

# 6075. T368 For Sale -- Near Chicago

Yahoo group: T-368_BC-610
Date: 2015-03-15 18:37:52 UTC
From: Walter Klinger
Topic: 6075  Message: 6075

I have a Bendix T-368 For Sale.

Bought it from a good guy down in Kentucky who got it reworked by Robert W0VMC

Has a pair of 4-400's in the modulator and a pair of 4-400's in the PA.

The transmitter works well, and I swear is the nicest sounding one that I have ever heard. That's why I bought it in the first place.

PLENTY of power out. A serious transmitter for the serious ham

Comes with a small audio chain and mic.

MUST pick up north of Chicago. Can demo on the air.

With the money that went into the rebuilding of this transmitter -- This is not a fire sale. Looking for a mutually amicable price.

Would prefer to discuss prices and terms over the phone.

708-653-2044

I never thought I'd really want to sell this- but... I have a spare T-368 exciter in 100% clean, un-modded, and intact condition, and if making it available kept one more T-3 in intact operative condition vs. being scattered around as parts, I might actually be more open than I thought to letting it go. I suppose if one parted-out T-3 puts a bunch of other limping, non-functional specimens on the air, that isn't all bad, either.

I agree I sure would hate to see it parted out just because it needs the exciter, they are for sale now and then, and I too have a spare for my T-3 that I would rather keep, but if it is needed to get another one on the air I would sell it.

Yahoo group: T-368_BC-610
Date: 2015-03-25 00:59:37 UTC
From: kd1yt@...
Topic: 6076  Message: 6079

I have had one person write to me about the exciter as a possible way to get the T-3 that started this dialogue back on the air, and my mind is open (though with my endemic difficulty of getting rid of fascinating stuff like this- I'd always wanted to use the T-3 exciter for a standalone medium power homebrew rig)--

-- but I am at a total loss as to what would be a fair price to both buyer and seller for a nice-condition original T-3 exciter.

I bought my exciter from Fair Radio in or soon after 1990 when it was a standard item in their catalog; I know that it was definitely not cheap at the time (it was a stretch under my budget at the time), but I don't have any recall of what I paid for it- and not that what I paid really correlates to current anyway

Any suggestions on what would be a fair price for both a buyer and seller of a VFO?

Even if the person or persons who want to put this T-3 that started this discussion on the air can't come up with an original equipment VFO right away- if all that the 'specimen' that started this discussion is missing is the VFO, the back cover, and needing a cabinet repaint- it seems a shame to reduce an otherwise nearly compete T-3 to a diaspora of parts. Back panel could be made 'good enough to wrk' without much trouble, cabinet paint no biggie, and with all of the options that are out there now for digital readout highly accurate DDS VFOs, a (even if a stopgap) DDS VFO subchasis 'styled' to look like 'what A T-3 would've had if it had a digital readout VFO'.... The stock VFO is cool as an example of R-390-like PTO plus permeability tuning with all of the deranged-genius cam train whirling around .... but a modern VFO could probably run rings around it, and the best functional features of a T-3 probably don't depend on the O.E. VFO

# 6080. BC-610-E MWO clarification

Yahoo group: T-368_BC-610
Date: 2015-04-02 11:27:37 UTC
From: littlewoodj@...
Topic: 6080  Message: 6080

Hi all,

I would like to know what the modifications on the following work order are for:-

as per my BC-610-E,

MWO SIG 11-281-2-5-6 (I know what 2 & 5 are for)

MWO SIG 11-4057-1

many thanks James

# 6081. Re: [T-368_BC-610] BC-610-E MWO clarification

From: wa5cab@...
Topic: 6080  Message: 6081

James,

I do not have the actual MWO's, only the titles.

MWO SIG 11-281-6 Modification of Radio Sets SCR-399-A, and SCR-499-A; To improve operation of High Voltage Control Circuits in Radio Transmitter BC-610-E.

Source SR 310-20-4 of 01 January 1950.

I have a note in my database that says "Interlock Switch Changes", but no reference to source. The BC-610-E schematic in TM 11-310 was not changed as late as Change 8 of 31 July 1947. So I assume that one, two or all three of the interlock switches were replaced with different switches. One of the switches is on the back of the modulator deck, operated by the rear cover. The other two are in the top of the transmitter, operated by opening either access door. The three are electrically in series.

I don't have MWO SIG 11-4057-1 either but located a description in DA PAMPHLET 310-4 dated 19 November 1958.

MWO SIG 11-4057-1 Modification of Radio Transmitters BC-610-E and BC-610-F to reduce plate and screen voltage of buffer-doubler stage.

I would think that the simplest way to achieve this would be to insert a resistor somewhere between L1 and Ch5 / R25. A few ohmmeter tests would confirm or deny this.

Topic: 6080  Message: 6082

I might be able to add some info to the interlock switches issue.

When I acquired my BC-610-E about ten years ago it was missing the two top cover interlocks, although there was a pair of switches in the spares that came with the TX they were the wrong type and didn't fit the cut-outs in the top cover. After discussing the switches on this group, someone sent me some photos of the right type for my TX. So, there were at least two types made and fitted and I do have photos of both, one of which has a part number on it.

James, if you need the photos let me know by e-mail and I'll respond there.

Thanks Robert, im in the process of replacing some out of spec parts and have come across a few odd figures, R25 was one of them, spec should be 47k 2W but installed was a 97k 2W. I was expecting one of the MWO's to be installation of SO-239's as mine has them plus the original ceramic fittings.

Many thanks
James

James,

A change to R25 would accomplish part of the change described. But it wouldn't change the plate voltage. I take it that you did not find an additional resistor in that general vicenity? Another possibility would have been to move the primary tap on T4 from the 100V to the 115V tap. However, that would also reduce the voltage to the MO and the IPA.

I don't know what the deal is with the SO-239. I think that shows up on the schematic for T-213/GRC-26, but the T-213's were all converted from -F and later models. And before anyone says that the source was only -I models, I once bought three T-213's still in the depot crates. From the transformers, one had definitely been an -F. Anyway, the earliest MWO listing that I have is in FM 21-6, dtd 1946 (I also have partial copies of three earlier ones but whomever copied them did not copy the TM and MWO pages). The 1946 edition only lists MWO 11-281-2, -5, -6, -9 & -10. This is the same as listed all the way up through at least 1958 in DA PAM 310-4. So I can't say what happened to the missing numbers. It is also possible that your transmitter was modified by someone other than the Signal Corps.

From: commtekman@...
Topic: 6085  Message: 6085

Hi all,

I am having a new work shop, ham shack being built. What is the recommended 120V breaker for the T-3? I think one of my manuals indicates it may draw 2200 watts on AM.
The T-3 is an E model.

Thanks,
Bob K6OSM

Make sure it's dedicated circuit for the T3

When I bought my T3 it came with a 220 volt transformer that dropped the voltage down to 110 @ 30 amps .. it needs a 30 amp line and most homes as you know run 15 and 20 amp circuits so either put in a heavy duty line just for the T3 or get the transformer. I'd run a line myself because the transformer is always drawing power even if the T3 is off ..

Ok Don, great advice. I will be having the electrician run a four wire 30 amp
service just for the T3. BTW, when I purchased this T3 from a ham in Idaho
he also had a military caged transformer with multiple taps on top, it
will provide large current outputs, I purchased this xmfr from him and still have it
available, it is really heavy. The output with a 120 input goes up to 480-

30A is overkill. Draws 19.8A @ 120V
Check you line voltage.

While the four wire 240 single phase circuit is a great idea to run in case you want to run a 240 linear sometimes, you'll only need one leg of that for the T-368 and it can be fused at 20 amps. I've run my T-368 for several years on a 20amp/120V circuit which almost one hundred feet of 12/3 copper from the service entrance to the rig. That circuit also powered the R-390A and some other small items. My rig would put out over 400 watts on AM but I usually throttle it back to about 350. I miss the rig.

Rodger,
FB on the info. I am trying to think ahead on this as once the wall covering is
in place it won't be easy to change or modify. This rig is the E model made by
Bendix and near as I can tell it has not been modified by anyone.

Like you, I have too many R-390, R-390A, and R-389 and R-391. It seemed years ago when this stuff was available I couldn't help myself from buying, guess I need a support group of some kind~

Hi Robert

I found no other resister or modification other than the one I have attached, some resisters differ in value for example R2 is 4k Ohms, should be 5k Ohms I assume that¹s what they had to hand rather than a mod? T4 primary was as you indicated on 115v, what would the significancy of this to the function of the TX?

Cheers James

James,

A change to R25 would accomplish part of the change described. But it wouldn't change the plate voltage. I take it that you did not find an additional resistor in that general vicenity? Another possibility would have been to move the primary tap on T4 from the 100V to the 115V tap. However, that would also reduce the voltage to the MO and the IPA.

I don't know what the deal is with the SO-239. I think that shows up on the schematic for T-213/GRC-26, but the T-213's were all converted from -F and later models. And before anyone says that the source was only -I models, I once bought three T-213's still in the depot crates. From the transformers, one had definitely been an -F. Anyway, the earliest MWO listing that I have is in FM 21-6, dtd 1946 (I also have partial copies of three earlier ones but whomever copied them did not copy the TM and MWO pages). The 1946 edition only lists MWO 11-281-2, -5, -6, -9 & -10. This is the same as listed all the way up through at least 1958 in DA PAM 310-4. So I can't say what happened to the missing numbers. It is also possible that your transmitter was modified by someone other than the Signal Corps.

James,

Pleas recheck specifically R3 (15K). R6 & 7 (20K) and R24 (500). Is R3 actually 4K or perhaps 4.7K? And confirm R25 as 97K and not 91K or 100K. 97K (actually 97.6K) would be an EIA 1% value.

In any case, there would be no change in the operation of the 6V6 oscillator as its plate and screen voltages are regulated at 300 and 150 VDC by the three 0D3's. Power input to the 6L6 buffer-doubler would be decreased around 20% and power output of the 807 IPA's would decrease. As the output power of the 250-TH was supposed to be set by loading to a specific plate current, at least on the lower frequencies I wouldn't expect any net decrease in standard output power from the transmitter. Ham's tend to load everything for maximum smoke (one reason for ICAS ratings), and the maximum smoke capability may have decreased. But that depends upon whether the exciter had excess drive capability before the MWO. Which I don't know the answer to. But the short answer is that the transmitter probably still produced the same rated (not maximum) output power with less input power.

Hi Robert

I have re-checked, R3 is (15.5k), R6 & 7 (20k) R24 (500). R2 (4k). R25 was 97k however per my manual TM 11-826 dated 52 the value for this resister is 47k 2watt so I replaced the 97k for the correct spec value, is the manual incorrect? Would this difference in value cause me issues?

Cheers James

James,

Are those measured values (actual as-found) or marked values?

Power input to the 6L6 buffer-doubler would be decreased around 20% and power output of the 807 IPA's would decrease. As the output power of the 250-TH was supposed to be set by loading to a specific plate current, at least on the lower frequencies I wouldn't expect any net decrease in standard output power from the transmitter. Ham's tend to load everything for maximum smoke

(one reason for ICAS ratings), and the maximum smoke capability may have decreased. But that depends upon whether the exciter had excess drive capability before the MWO. Which I don't know the answer to. But the short answer is that the transmitter probably still produced the same rated (not maximum) output power with less input power.

From: wa5cab@...
Topic: 6080  Message: 6099

OK. When this thread started, I assumed that you were quoting marked values. What was the marked value on R-25?

Read Note 3 on Fig. 76 (BC-610-E Schematic Diagram) in TM 11-826. It says that in BC-610-E's modified by MWO 11-4057-1, there is a 2K resistor between R-25 and TS2 Terminal 9. The wiring diagram (Figure 84) shows one wire running from TS2 Terminal 9 to junction of R25 & CH5. So it isn't clear whether R36 is added in the wire betweenTerminal 9 and the junction or whether R25 was removed from the junction and R36 tied to it and the junction. There is no mention of moving the primary tap on T4.

Also, Note 2 and the dotted lines on Figure 76 explain MWO 11-281-6 and imply that it only applied to 30204-PHILA-43 Serial Numbers below 5191.

Finally, the original marked value on R25 was 50M (M was used until around 1945 to mean "X 1000"). On later schematics is is shown as 47K. It is possible that R36 was added only in series with R25 to get the value back up to 49K. Which still doesn't have anything to do with the buffer-doubler plate voltage???

Robert,

Attached is what I removed from R25 position its labelled green, black, orange so I guess it shows what you have explained, they didn¹t add a 2k in series they replaced R25 with a 50k 2watt, to keep as per MWO I will replace the new 47k with a 50k.

The order No. on my TX is 26804-PHILA-44.07 Serial No. 33 Made by C.D.T

Many thanks
James

I'd go with the 30 amp circuit.  The Code says if the load runs for 3 hours it should only be rated at 80% which puts it at a 30 amp circuit.

While on the topic of T-3 power draw....

Anyone happen to know what the approximate actual power consumption is during times when the rig is _ready_ to be keyed for AM transmit, but not actually keyed?

I don't yet have my T-3E airworthy (I am afflicted or blessed, depending on how you look at it, with fun projects that multiply faster than free time)...

...but, I live in a location where my electric cooperative has ferociously high electric rates [21 cents/ kwh] and I sometimes dread what my power bill will do when I do get the T-3 on the air if I spend significant time (even without carrier key-down at large portions of time) operating with it.

I'd go with the 30 amp circuit. The Code says if the load runs for 3 hours it should only be rated at 80% which puts it at a 30 amp circuit.
Joe

On Sunday, April 12, 2015 5:27 PM, "Don Allison wc4don@... [T-368_BC-610]" <T-368_BC-610@yahoogroups.com> wrote:

When I bought my T3 it came with a 220 volt transformer that dropped the voltage down to 110 @ 30 amps .. it needs a 30 amp line and most homes as you know run 15 and 20 amp circuits so either put in a heavy duty line just for the T3 or get the transformer. I'd run a line myself because the transformer is always drawing power even if the T3 is off ..

From: commtekman@...
Topic: 6104  Message: 6104

Hi all,

I have a question concerning an item that was apparently used with the T3 at various times,
it is shown on page 2 of TM 11-809-10. Page 2 of this TM shows it on a shelf directly above
a work bench. This item is identified as: Generator, Interference, MD-22D/URA-T1 and was
made by Columbus Electronics on Order # 07181-PP-59. I have been searching for a
TM for this item with no luck, anyone know anything about this item as to it's usage and
what TM would cover it's operation?

Thanks
Bob K6OSM

Bob,

MD-22D/URA-T1 is part of AN/URA-T1X Manuals that cover it are TM 11-2509A with Changes 1 through 4. Or TM 11-6940-203-12, -35 and -35P. I do not have the -12 or the -35P. I have one original of the other two that I could eventually scan and reprint. Between the two, unless someone turns up TM 11-6940-203-12 and -35P, I think that TM 11-2509A with changes has a little better coverage. For example, operation of the MD-22(*)/URA-t! requires AN/GLQ-2 and T-368/URT is mentioned in it but I didn't find any mention in the -35.

MD-22B/URA-T1, along with RT-260/GLQ-2, T-368/URT, R-390/URR, AN/GRC-5, PE-95-G and Shelter S-56/G, along with a bunch of accessory and antenna components are all part of AN/GLQ-2 (TM 11-640A). It replaced AN/MRQ-2. It is a 500 watt HF jammer set covering 1.5-20.0 MC.

MD-22D/URA-T1 is just a later production model. There are internal differences between it and the B model but the operational characteristics are the same.

Note that there is almost no discussion of actual jamming operations in any of the manuals. About 90% of TM 11-640A is about the RT-260.

# 6106. T-368 versus T-3

Yahoo group: T-368_BC-610
Date: 2015-04-18 05:06:39 UTC
From: wa5cab@...
Topic: 6106  Message: 6106

I know that some people think that it's cutesy or "in" to refer to a T-368 as a T-3. But it always irritates me because it's obviously incorrect. And more so even than calling a BC-696 an "ARC-5". At least the BC-696 looks sorta like a T-19/ARC-5, even if the two are not interchangable. In any case, the full nomenclature for the T-3 is T-3/CRN-2. It was a 329-335 MC crystal controlled AM transmitter used to provide the glide slope signal in a late WW-II blind landing system. It doesn't look anything like a T-368/URT.

It is not cutesy at all, but a widely accepted name for a T-368. I had my T-368F for over 30 years and always refer to it in conversation as my T3 and will continue to do so. The fact that there may be an obscure hardly heard of actual T3/CRN-2 is not even relevant. Everyone knows what us T3 owners are talking about when we use the term. There are more significant things to be irritated over. 73 - Mike

No, definitely WW-II. Earliest hard listing that I actually have for it is SIG 5-1 dated August, 1944. But the nomenclature must have been assigned in late 1942 at the beginning of the switchover from the separate Army, Navy and Coast Guard nomenclature systems to the JAN system.

I think I am the person who made the reference to the T3. For those of you who do not know me I was in Germany 55 years ago when we actually used this equipment every day that most of us now like to collect. The transmitter tech's who worked on the T368 always referred to them as the "T3", everyone knew what that meant and there was no confusion to something else. For those I have confused, I apologize for a term that was freely used during the Cold War in Europe for this piece of equipment.

Yep and calling a BC-696 "a" ARC5 or calling a Land Rover a jeep are also widely practiced errors. That doesn't make any of them right. There are certainly many things more important to be irritated over but mentioning 99-44/100% of them here might get you kicked off the list.

Well, I'm glad to see that at least you served a hitch. Many of our compatriots didn't. I spent the third and fourth year of my 32 on a pleasant (not so much) cruise to S.E.A. that was a little warmer than the Cold War. For HF, we had AN/WRT-2's and AN/URC-32's instead of T-368's So being only moderately lazy, we called them WRT-2 or URC-32, or sometimes with the latter, the "B" model or the "C" model (we had a bunch of "A" models but only one each of the two later ones).

Yes, I did not serve. However, I have been working for the military for 50 years and still do, at a few months from becoming 70. Most of the first 20 years was in ASW, so the government decided it was more important for me to continue doing that rather than go to Vietnam. The last 30 years has been mostly in SATCOM. Who knows, maybe some of us compatriots saved your life, as well as that of others who served, and I truly admire and thank all of you who did serve. Coming here as a refugee from a Communist country, I know freedom does not come without the spilling of blood. 73 - Mike

Well, I'm glad to see that at least you served a hitch. Many of our compatriots didn't. I spent the third and fourth year of my 32 on a pleasant (not so much) cruise to S.E.A. that was a little warmer than the Cold War. For HF, we had AN/WRT-2's and AN/URC-32's instead of T-368's So being only moderately lazy, we called them WRT-2 or URC-32, or sometimes with the latter, the "B" model or the "C" model (we had a bunch of "A" models but only one each of the two later ones).

There appear to have been variations, the decks on mine are at least two different shades of gray. Some auto parts places can match a color if you can bring some part of the rig to let them do their matching. Lowes, and probably other places will also blend colors, and you can get 'samples' in smaller quantities; latex is not correct, but for small touch ups may be fine.

Does anyone know the correct color to match the gray on the T3?
I would like to do a couple touch ups. Quart, pint or spray can is ok.

The term "T3" is not an "error", its a colloquialism and... this list is a hobby list about the T3's operation, maintenance, and repair and by the way, Beastly 610's... its not a mill list... its not a collector list and... no one other then you was "irritated" till you became irritated and decided to share your irritation... again... and again... and again...

AM hams on the east and west coast have referred to the T-368 as a T3 since roughly 1980 and will most likely continue to refer to the T-368 as a T3 long after you achieve room temperature...

At this point, T3's are bought, sold and used by hobbyists and some third world countries... buyers usually aren't interested in nomenclature as much as getting it going, enjoying it and most certainly, not your personal irritations...

The T3 descriptor is going nowhere anytime soon...

Either get over it or prepare to be irritated for the rest of your days...

73, Ott-out...

btw: another colloquialism... in the northeast corridor, the T3 nee T-368 has been referred to as the "Harley Davidson" of ham transmitters... a good a description as any for the venerable T3 with a nod to Joe Cro for coming up with that one...

When I purchased my T3 it came from someone that got it through MARS and it was in terrible shape. By that I mean cosmetically mostly, although it had multiple electrical problems as well. The first thing I did was totally dismantle the whole unit, taking off the panels of all three decks, stripping the wiring from the mainframe and so on. I found spray paint that was an almost exact match to the original, so, using numerous cans, I repainted the whole unit. Each panel along with the main case. This way everything looked perfectly matched. Fortunately my T368F was made by TRW and the labeling was depressed into the panel, so, I had to refill all of that. After that I am sure I used several coats of clear Krylon over it all to protect it. After that I rewired the entire mainframe with brand new HV cable. The finished product looked great and after I fixed the electrical issues it served me well for about 25 years, but, admittedly, I do not go down to the basement much anymore so have not used it in a while. 73 – Mike

I don't think that there is anyone who appreciates military communications gear of the WWII-mid-late Cold War vintage who does not have a deep and thorough degree of awe of the sacrifices, ingenuity, and triumphs of those who served; not all of us were born at a time when we'd have had the option to serve in such dire times - but don't forget that those who came after are part of keeping the memory alive- beyond books- of the extraordinary men and women- and the ordinary men and women who did the extraordinary- to whom we owe the world as we know it today. You don't have to have a certain work or service history to do so, nor do you have to have a certain political viewpoint to do so. I wish our country would get over the divisiveness gig of who's more this that and the other thing than whoever else (which to my mind is largely a product of politicians and others who want to distract us from the various ways we're getting fleeced and our rights eroded) and start to remember that we are (or should be) al proud to be citizens. Most dialogues where people start throwing around politically charged labels devolve fast into the equivalent of two four year olds yelling back and forth at one another, over and over, louder and louder, "I'm not a doodoohead, you're the doodoohead"

Grateful to receive the heritage and freedoms that we have, and trying to pass it all (the heritage, freedoms, and gratitiude) along to those who come next....

Thanks to all who have served our country, and to those who preserve and share knowledge, skills and freedom in any way.

Ott,

Actually, you're wrong. The membership here ncludes people like you whose interest in either the T-368 or the BC-610 is as a cheap way to a medium power HF transmitter. But it also includes a lot of collectors, most of whom are also military radio collectors to one degree or another. It's a fact that the two groups often don't play well together. But it's unlikely that any significant percentage are going to obligingly drop dead and disappear any time soon as you so rudely implied I should do.

Topic: 6106  Message: 6130

I don't know that I'd say 'cutesy', maybe more like a nickname or abbreviation used a lot between T-368 users and owners who understand and agree on the topic they're discussing as I've done on occasion. A bit different than the ARC-5 comparison from all I've witnessed. I'd put that more on par with those who call all Command sets 'ARC-5s' or refer to Type 12 gear as 'ARC-12' because they don't know any better or it just doesn't matter to them.

Far less understandable to me are those who refer to the R-390 as the R-390 non-A. Basically describing the equipment by what it isn't, instead of what it is. You don't hear folks referring to the SX-28 non-A or KWM-2 non-A, but the R-390 is apparently different. Or at least, some of its newer users are. I wonder if they drive a Toyota Prius non-Corolla or a GMC non-Chevrolet truck?

But yes - to simply use the term T-3 as a random or 'hip' way to describe the transmitter would seem foolish. Example would be showing up on a milsurplus list saying "I need some T-3 info". That opens the door to needless questions of clarification about the actual equipment you point out, Robert. Or maybe they mean transformer T-3 on some schematic, or....? About as sensible as popping up in some electronics group and asking for some Johnny balls. In the right company, it's perfectly clear.

# 6131. Ban on ebay Trading of Tech Manuals?

Yahoo group: T-368_BC-610
Date: 2015-04-22 06:44:17 UTC
From: Roger@...
Topic: 6131  Message: 6131

Hi All,

Since this group is the larger and busier of two I belong to with a largely American membership (the other being TCS_Radios) I thought I'd ask for some input on the following:-

Last week I tried to put three US military manuals on UK ebay. These were two WW2 radio training (one USN, one Sig Corps) and one 1957 Army/USAF Morse Code training. All were rejected with the following message:-

QUOTE/

Attention sellers:

Military Manuals

It appears you are attempting to list a military manual that may be restricted for sale as technical data under the US Munitions list found at ITAR Part 121. Due to the highly regulated nature of these items, which can restrict even sales within the US, eBay has made the policy decision to prohibit these items altogether. Therefore, this item is not permitted and please do not attempt to relist. Please see eBay’s Military Items policy http://pages.ebay.co.uk/help/policies/military-items.htmlfor more information.

Thanks for your attention to this matter.

UNQUOTE/

Now that message seems to me to be a rather sweeping statement, is a 1957 Morse Code training book such a threat? Or a technical manual with details of the BC-223? I appreciate that ebay have to obey the law but shouldn't they be a little more selective or is it, as I suspect, that employing someone to check listings is costing ebay money?

I asked on the UK VMARS group for the opinions of non-US collectors but responses were mostly about re-wording the item description to circumvent the ruling.

What do members think? Is this a just ruling, is it restricting trade in technical info for people like us? Looking on the dark side, how long before we can't sell radio items with any military pedigree? Are other auction sites in the US operating the same embargo?

Wot say OM?

73

Roger - G3VKM, Norfolk, England.

Roger,

Silly and unnecessary but understandable.

Where I work we have a whole team in the legal department that deals with ITAR issues and we handle few items that fall under ITAR. But we do deal with far more items that, to the untrained eye, could fall under ITAR.

Part of the problem is the way ITAR works. If you have an ITAR controlled item you are responsible for its handling and the penalties are severe if you make a mistake.

A example came up when I bought a manual (not Ebay) that was actually never officially declassified. When it arrived I saw the markings and immediately put it under control . Then I worked to determine the documents status. Just like ITAR since I have the manual it is now my problem no matter how I obtained it. It took 8 months to find someone in the USG who remembered this item and declassified it. It should have been routinely declassified in the 1950s.

This came up on eBay when I bought a piece of SIGINT gear from a seller in the UK. Well, I could buy it and own it but I really cannot sell it because of ITAR concerns. And it was made in the US.

I would have thought that the eBay use agreement would have indicated that the seller is responsible to make sure the item is either not controlled or is properly handled.

I guess they either got burned or their legal staff felt that Ebay would still be culpable for ITAR issues regardless of the use agreement.

I have obtained many hard to find manuals I. EBay. I guess those days are over. If the manual is not ITAR controlled and you have to reword it in order to sell it, then that may be your only option using eBay. Of course the trick is to still wording folks can search for.

Sorry I am not much help here,

Gary WA0SPM

Roger,

It's possible that the censorship has (so far?) only been applied to the UK site. Before reading your message last night, I had just bought an original TM 11-487B (1951 edition, and one of only a few of the series that I don't already have). After reading your message, I listed on eBay (US) as a test three of my reprint manuals (AN/ARC-5 Maintenance, AN/ARC-5 receiver channelizer module, and AN/VRC-1). All three listed no problem. What were the three manual numbers that you tried to list?

Hi Robert,

The two training manuals didn't have TM numbers, they were USSC and USN workbooks that a candidate filled in as part of their training to be a radioman. Have a look at my listings, search for "hadrad" completed items. I expunged all references to US, army, navy and TM numbers and just described them as radio training books.

Yes, it's possible that someone in Customs over here has come down on ebay, probably after a complaint from your side of the water and ebay have adopted a better safe then sorry policy. There was a scare a couple of years ago about export licensing that threw up some worrying comments but all seemed to go quiet after a few months.

Roger,

It's possible that the censorship has (so far?) only been applied to the UK site. Before reading your message last night, I had just bought an original TM 11-487B (1951 edition, and one of only a few of the series that I don't already have). After reading your message, I listed on eBay (US) as a test three of my reprint manuals (AN/ARC-5 Maintenance, AN/ARC-5 receiver channelizer module, and AN/VRC-1). All three listed no problem. What were the three manual numbers that you tried to list?

Roger,

Silly and unnecessary but understandable.

Where I work we have a whole team in the legal department that deals with ITAR issues and we handle few items that fall under ITAR. But we do deal with far more items that, to the untrained eye, could fall under ITAR.

Part of the problem is the way ITAR works. If you have an ITAR controlled item you are responsible for its handling and the penalties are severe if you make a mistake.

A example came up when I bought a manual (not Ebay) that was actually never officially declassified. When it arrived I saw the markings and immediately put it under control . Then I worked to determine the documents status. Just like ITAR since I have the manual it is now my problem no matter how I obtained it. It took 8 months to find someone in the USG

who remembered this item and declassified it. It should have been routinely declassified in the 1950s.

This came up on eBay when I bought a piece of SIGINT gear from a seller in the UK. Well, I could buy it and own it but I really cannot sell it because of ITAR concerns. And it was made in the US.

I would have thought that the eBay use agreement would have indicated that the seller is responsible to make sure the item is either not controlled or is properly handled.

I guess they either got burned or their legal staff felt that Ebay would still be culpable for ITAR issues regardless of the use agreement.

I have obtained many hard to find manuals I. EBay. I guess those days are over. If the manual is not ITAR controlled and you have to reword it in order to sell it, then that may be your only option using eBay. Of course the trick is to still wording folks can search for.

Sorry I am not much help here,

Gary WA0SPM

Hi All,

Since this group is the larger and busier of two I belong to with a largely American membership (the other being TCS_Radios) I thought I'd ask for some input on the following:-

Last week I tried to put three US military manuals on UK ebay. These were two WW2 radio training (one USN, one Sig Corps) and one 1957 Army/USAF Morse Code training. All were rejected with the following message:-

QUOTE/

Attention sellers:

Military Manuals

It appears you are attempting to list a military manual that may be restricted for sale as technical data under the US Munitions list found at ITAR Part 121. Due to the highly regulated nature of these items, which can restrict even sales within the US, eBay has made the policy decision to prohibit these items altogether. Therefore, this item is not permitted and please do not attempt to relist. Please see eBay’s Military Items policy http://pages.ebay.co.uk/help/policies/military-items.htmlfor more information.

Thanks for your attention to this matter.

UNQUOTE/

Now that message seems to me to be a rather sweeping statement, is a 1957 Morse Code training book such a threat? Or a technical manual with details of the BC-223? I appreciate

that ebay have to obey the law but shouldn't they be a little more selective or is it, as I suspect, that employing someone to check listings is costing ebay money?

I asked on the UK VMARS group for the opinions of non-US collectors but responses were mostly about re-wording the item description to circumvent the ruling.

What do members think? Is this a just ruling, is it restricting trade in technical info for people like us? Looking on the dark side, how long before we can't sell radio items with any military pedigree? Are other auction sites in the US operating the same embargo?

Wot say OM?

Hello Gary,

Thanks for the info and it's more relevant coming from someone who deals with ITAR first-hand. Most people have advised me to reword my descriptions and list again, which I did without problem, removing all the references to military, TM numbers or a particular Service in my description.

Is there an ITAR list on-line that one can refer to before trying to sell an item? If there is, I doubt that my books would be listed, although the incident you mention of a 50s manual slipping through the net is always possible, I suppose.

73 and thanks again.

Roger ,

Head over to www.fas.org and look at the ITAR classification categories

It gets murky when language like, "Includes but is not limited to" appears. While military communications transceivers without COMSEC, spread spectrum, jamming, or anti-jamming appear to not be an ITAR issue, the phrase given above makes it anyone's guess.

"XI 4 iii" is a prime example.

I think my T-368 is okay, but the Racal "JamCat" I bought off eBay seems suspect so I won't be selling it either.

Even the clarifications given aren't much help unless you are dealing with pyrotechnics.

We have an equipment list for gear we use; I am unclear of its origin. I have never a general equipment or document list.

The ITAR concept seems reasonable and I would argue necessary. There have been changes in ITAR with more proposed to keep it effective but not unnecessarily constraining. I think ebay's interpretation and implementation now need a little tuning as well.

Thanks Gary,

I'll take a look at that site. However, if it's anything like the UK export licensing site I'll be none the wiser. They too go in for these catch-all clauses! My BC-610 was probably Lease-Lend gear, so country of origin maybe won't be so obvious on any official paperwork. However, at 400+ pounds weight I doubt I'll shipping abroad! About the only crypto gear I have is a TypeX cypher machine PSU, hopefully the dynamotor in it is off the Secret List by now.

73 and thanks for the advice.

There appear to have been variations, the decks on mine are at least two different shades of gray. Some auto parts places can match a color if you can bring some part of the rig to let them do their matching. Lowes, and probably other places will also blend colors, and you can get 'samples' in smaller quantities; latex is not correct, but for small touch ups may be fine.

Mike, do you have the mfg and number for the match? ACE has many different grey colors. It might save me many trips back and fourth. I can say it's not Dark Machinery Grey.

Regards

David

When I purchased my T3 it came from someone that got it through MARS and it was in terrible shape. By that I mean cosmetically mostly, although it had multiple electrical problems as well. The first thing I did was totally dismantle the whole unit, taking off the panels of all three decks, stripping the wiring from the mainframe and so on. I found spray paint that was an almost exact match to the original, so, using numerous cans, I repainted the whole unit. Each panel along with the main case. This way everything looked perfectly matched. Fortunately my T368F was made by TRW and the labeling was depressed into the panel, so, I had to refill all of that. After that I am sure I used several coats of clear Krylon over it all to protect it. After that I rewired the entire mainframe with brand new HV cable. The finished product looked great and after I fixed the electrical issues it served me well for about 25 years, but, admittedly, I do not go down to the basement much anymore so have not used it in a while. 73 – Mike

There appear to have been variations, the decks on mine are at least two different shades of gray. Some auto parts places can match a color if you can bring some part of the rig to let them do their matching. Lowes, and probably other places will also blend colors, and you can get 'samples' in smaller quantities; latex is not correct, but for small touch ups may be fine.

The 'original' paint seems to have varied over time & or between contractors, anyways; my un-re-painted T-3-E has _at least_ three slightly but observably distinct shades/tones as between the cabinet and the various decks. One of the decks (forget if it is the PS or modulator deck, I think it's the mod deck, looks like it received a brush re-paint [a decent one, but it is on a little thick] at some point along the way. I just view the mix of different shades/ tones as part of its history, just like some antique rifles are best left un-refinished, because their imperfection is part of their story and authenticity.

David -

As pointed out by others, the colors used on the T-368 undoubtedly varied somewhat through the years, mostly relating to depot maintenance.

It's my guess that they all started out as Federal Standard FED-STD-595A, color code 26152, Semi-Gloss Gray like the R-390 series of radio equipment. Though there were likely small variations across the manufacturers and their suppliers, they all would've been pretty close off the assembly line. From there, the course of time and overhaul schedules would change things more noticeably.

Add to that 3+ decades of private ownership and the 'close enough' colors used by different owners and it becomes anyone's guess. Depending on the overall condition and amount of touch up needed, it might be worth a uniform repaint as Mike mentions.

Good luck with it -

~ Todd, KA1KAQ/4

# 6144. T-368 AC power plug

Yahoo group: T-368_BC-610
Date: 2015-04-30 03:23:54 UTC
From: Chris Farley
Topic: 6144  Message: 6144

Hi all,

I located a box of original Arrow-Hart "Hart-Lock" AC power plugs, as used on the T-368 and probably other pieces of mil gear.  This is the female two conductor 20A twist-lock style cable end connector complete with metal body cap and strain relief clamp.  They are NOS so some of the zinc plating shows slight signs of oxidation, but overall they look pretty darn good.  Not rusty or anything.

If anybody needs one, I'm offering them to list members for $10/ea plus $3 conus shipping.

Regards,
Chris kc9ieq

The original manual on the T-368/URT (basic unlettered model) is TM 11-809 dtd 04/22/55. There was a Change 1 dtd 12/11/56 that covered T-368B. What happened to T-368A I don't know. Perhaps there was a TM 11-809A or an un-numbered Preliminary that I have never come across. Although the date is late for the number, 11-809 and C1 were superceded in 1958 by 11-809-10, 11-809-20 and 11-809-35. With Changes 1, 2, 3, and 5 (4 was superceded by 5), this covers T-368, A, B, C, D and E.

I only have one original but I scanned it for reprinting some years ago. I have copies of 2 PDF's that are floating around, and know what you mean about the quality, especially of the photographs. Although my scan was done long enough ago that it is at 400 DPI, the photos were scanned 256 gray and merged into the text which was scanned B&W. And the photos are nearly as good as the original. If it was a thinner manual and I printed it center-folded, stapled and trimmed, you would probably think it was an original, as has happened a few times with other manuals that I do..

Unfortunately, I only have one original copy left of the -20 and the -35.

The only T-368 parts that I have are a HV supply out of an unknow model and a couple of TN-339/GR and ME-65/G.

Hi Chris,

That would be great. Let me know how to pay. Grainger has one that they call a L2-20R, which is the receptacle and not the connector. The one Grainger shows is polarized in that one opening is wider than the other.

Bob K6OSM

Of course, Chris's NOS originals are preferred (and cheaper than Grainger) but back in the 80's and 90's I used to find some of the several polarized versions at flea markets. The metal innards are the same in all of them (or at least most of them). All that it took to modify one to work was to remove the bakelite front and use half of a jig saw blade in a home-made holder to cut the naarrow arc so that it matched the wide one. You can't, however, do that with current white and clear plastic ones and make them usable. Around the time that they quit making the bakelite body ones, they also increased the outside diameter just a little. I haven't paid any attention to the AC connector on the one T-368 power supply deck that I have but at least on the BC-610, the connector is a 2-pole recessed male. The ID of the connector body is smaller than the OD of the new plastic plugs. And you can't just chuck it in a lathe and turn it down to fit as the wall thickness is less than half the difference. Before you reduce it enough to fit, the front will fall off.

Good morning Group.
This is my initial posting here as I'm a new owner / caretaker of a very nice BC-610i.
My first question is in regard to the serial numbering. Does the serial number run sequentially from the beginning of production, or by year?
Thanks.
Dave w9ocm

Hi Chris,

That would be great. Let me know how to pay. Grainger
has one that they
call a L2-20R, which is the receptacle and not the
connector. The one Grainger
shows is polarized in that one opening is wider than the
other.

I can't say for certain that this applies to the BC-610-I but Signal Corps serial numbers were normally tied to the Signal Corps Order Number. The Order would have specified the beginning and ending serial numbers. The Order Number included the 2-digit US Federal Fiscal Year (which in those years ran from 01 July of the previous calendar year to 30 June of the current calendar year. So an Order Number ending in -51 could have been issued as early as June, 1950. This, plus a guess at manufacturing lead time, yields a fairly accurate way of dating a piece of equipment made before around 1958.

Hi Robert.

Here's the serial plate info:
Model BC-610i
Contract 3357-Phila-52
Manufacturer Hallicrafters
Serial # 642

With your knowledge, how would you read that?
Many thanks.

Dave,

Given that the differences between the BC-610-H and BC-610-I are minor, there wouldn't be any reason Hallicrafters couldn't have started production as soon as they had the Order, I would guess a production date in the Fall of 1951.

From: wa5cab@...
Topic: 6157  Message: 6176

Short answer is yes. I looked at two BC-610-F, a chassis connector salvaged from a BC-610-E, and the connector on the remnant of a T-368 modulator deck and allowing for being made in different decades and probably different contractors, they are all the same. So a power cord that would fit one witll fit the other.

# 6177. Re: [T-368_BC-610] T-368 power connector

Yahoo group: T-368_BC-610
Date: 2015-06-27 22:35:06 UTC
From: Chris Farley
Topic: 6157  Message: 6177

OK, thanks.  I don't know of a 610 locally, and couldn't find a good photo online showing the chassis connector.  I finally found an image somewhere, and it appeared to be the same plug/socket but of the opposite gender (male on cable, agreed not wise).  Apparently this was not an accurate assessment.  Thanks for the clarification!
Regards, Chris kc9ieq

Subject: Re: [T-368_BC-610] T-368 power connector

Short answer is yes.  I looked at two BC-610-F, a chassis connector salvaged from a BC-610-E, and the connector on the remnant of a T-368 modulator deck and allowing for being made in different decades and probably different contractors, they are all the same.  So a power cord that would fit one witll fit the other.

  The BC-610 has a male on the transmitter and a female on the power cord.  Doing it the other way around would make the power cord a suicide cord (or maybe a Darwin Award generator).

Chris, you were probably looking at a photo of the supply end of the cable. In the SCR-399, 499 and AN/GRC-26, which is where the BC-610-(*) and T-213/GRC was mostly used, the AC cord from the transmitter plugged into the JB-70 or equivalent, along with the AC cords from the BC-614, and a couple of power supplies or battery chargers. The supply end of the cable was male, of course.

Post the link to the photo and I'll try to confirm.

# 6180. BC-610E L1 power inductor

Yahoo group: T-368_BC-610
Date: 2015-07-14 12:10:39 UTC
From: mail@...
Topic: 6180  Message: 6180

Hello,

I am in the process of restoring a BC-610E and among the numerous issues I have found I think I am in need of a replacement L1 filter reactor on the RF deck. Specs are: 6Hy, 250ma; 90 ohms DC resistance. The original is a metal cased Stancor item. Found an open power resistor R3 (15k 20W) in the screen supply for the 6V6 oscillator that must have been related to some event that caused all this to go bad.

I had completely stripped this chassis and repainted it and made new silk screens for all the tube labels etc. Lot's of work but in the end I think it will be worth it.

Some strange things were going on in this area and I was really disappointed to find the open filter inductor!

Any help appreciated.
Thanks
Gary Schulz
Chicago, IL

Photo added to album titled: Gary's BC-610E, BC-610C and HT-4- showing the RF deck after painting. All chassis have been stripped and I had them Nickel plated for conductivity and corrosion resistance then I repainted them and made silkscreens for all the original lettering. The L1 inductor I am looking for is shown in the picture (after I refurbished it of course!).

# 6183. BC610E with RS384 in final

Yahoo group: T-368_BC-610
Date: 2015-07-20 20:50:36 UTC
From: radiokid@...
Topic: 6183  Message: 6183

Hi, I have replaced an old Telefunken tube RS384 instead of the original 250TH in the final,and the tube works very well in class B with more output,less driver power,less neutralization C and becomes not red,sitting above the socket of the 250TH without own socket and without drilling any hole in the transmitter.After improving temperature drift the BC610 is working nice with its own tuning units,for example 400watts or more on 20m no problem.
neg.grid voltage is abt 130V screengrid abt 350V plate current over 400mA screeengridcurrent abt 100mA final grid current abt 20mA . for reducing the now very little chirp,I will change the operating parameters next weeks.
greetings from Germany,listen on 20m,will be active there somedays with it in CW midnight.

Hi:

Trying to complete a BC-610/SCR399 station and need two items:
1) The cable that runs from the JB-70 Junction Box to
the BC-312 receiver
2) A complete RA-63 Rectifier unit for the BC-312 receiver.

Please email your reply to bogue182@gmail.com.

Thanks for your attention.

They're known as "Raytheon" knobs

I don't know if anyone sells just the spinner part without the rest of the knob.

$urplu$ $ale$ of Nebra$ka carries the full spinner knobs, but at a steep price.

Fair Radio may have them from time to time

Apparently they're still made/ used, although I have no idea on price, vendor channels, or whether you could get the spinner part by itself:

In defense of SSN, I don't think their pricing is unreasonable (generally) for the low volume items they still stock for the ham and tinkerer market.  That mil spec Raytheon knob would probably be $60+ to buy brand new through the regular channels.  Double check the dimensions, but I believe SSN p/n (KNB) 175-6-2G is the one you're looking for.  If you can find it cheaper elsewhere more power to ya, but I don't think $24 is terribly unreasonable.

Fair points about SSN and the fact that they are carrying niche materials for a niche market in an era that's well past the bounteous tide of cheap surplus. I am glad that they exist and have bought things from them...

From: mail@...
Topic: 6195  Message: 6195

Hello,

Still in need of L1 on the RF deck. It is a screen supply swinging choke with a rating of 6Hy @ 200mA. Has anyone found a modern replacement that would work in this application? I was thinking I could just re-stuff the original Stancor housing with a new part but I am unsure how close to the original values I need to get.
Thoughts?

Thanks
Gary

Hi Scott.
I wish you well in your search for the 100th tubes. If by chance, you find a source that has more than you need, would you let me know? I'd like a back-up tube or 2 plus the 250ths for my reserve.
Many thanks.

Hi Scott,

Hope your quest is successful.

I wonder if anyone has experience of shipping 100 and 250THs and could maybe suggest what can be done to minimise damage in transit? A few years ago, I bought a NOS new-in-box 250TH from a dealer in Manchester who shipped it to me via the UK Post Office (now Royal Mail), a journey of less than 200 miles. Despite being further protected by a outer box full of bubble-warp, the 250TH was shocked so violently that the entire electrode structure separated from the supporting rods - but the envelope was intact. I have seen (on ebay) photos of 250THs in a shipping frame and wonder if anyone has used a frame for shipping in recent times? How were these valves packed when in the SCR-299, etc, and how come they appeared to survive "hopping shell holes"* in a standard truck but succumbed to the mail service?

It would take some time, but perhaps a piece of Styrofoam hollowed out in the shape of the tube and then bubble-wrapped wrapped. I wonder if that would work?

I have purchased and received intact 100TH and 250TH that were packed gawdawful amounts of bubble wrap in sufficiently large boxes. I have also received multiple RK65 and 250TH in factory boxes in which the tubes were supported by several springs, allowing the tubes to bounce around in a limited fashion. No bubble wrap was used as it didn't exist at the time. As an aside, The University of Oklahoma has a competition each year in which students devise ways to encompass an egg so that it won't break when dropped from a tall building. You might find some info on the internet about the winning methods. Brian wa5uek

I’ve read that there was a high DOA rate on these tubes in WW2 even with the shipping frames. Survival rate installed in theater radios must have been significant as well.

Well, experience suggest that USPS and Royal Mail are harder on parts than combat. :-) I have also shipped Eimac tubes (several 75TH to several recipients) and had them arrive with the grid and cathode structure rattling around inside of the envelope in small pieces. After that experience, I made a rule to never ship the 75 watt or larger transmitting tubes in boxes that met standard specs (i.e., minimum of 2" padding on all six sides). Since then, I have successfully shipped tubes up to the size of 450TH by following this rule. Ship in a box whose length and width are at least 1-1/2 to 2 times the height, and clearly marked on top with TOP, on bottom with BOTTOM and on the four sides with large arrows and the word UP. The height should be at least 4 inches greater that the height of the tube in its normal upright operating position. Obviously this will be a very large box and you will certainly have to pay a size penalty (the equivalent shipping weight may be three times the actual weight or more).

The idea is that by having the height of the box significantly less than the other two dimensions, the average uncaring transport employee will naturally tend to keep it that way. And it does seem to work at least part of the time.

The same comments apply to tubes like the 810, 813, 35T 872 and 211 (VT-4-C). Package them upright and in a box whose shape encourages the handlers to keep it upright.

Speaking of 211's, after about 5 years of intermittently looking, I finally located the box of 211's that I knew was around here somewhere. Some years ago, someone was holding up ordering a set of connectors for a BC-191 or BC-375 until I located the tubes. If you are still on this list and still need the connectors, I found the tubes. I still need to test the heaters but there were no bits of wire rattling around inside so they are probably OK.

Thanks all,

The Styrofoam suggestion is a good one. A few years ago I sold a pair of Mullard DO60 triodes to a Japanese audiophile/collector who shipped me a large box containing two separate boxes each with a shaped foam inner moulding especially shaped to fit a DO60. I've often wondered if he had a library of similar boxes for other tubes. I suppose one could use one of those kits that have a foam injector and a bag which you shape around whatever it is you're packing and which sets into a Styrofoam-like foam on curing.

My 250TH were shipped in the original cartons. Inside were metal frames with spring loaded collars around the top and bottom of each tube. I know this is beyond the scope of what an individual can do. But, I would take Robert's suggestion one step farther, another box with 2" to 3" of packing peanuts around all sides of the inside box. Yes, you will pay more for dimensional weight, but IMHO, it's worth it.TNX, Mike, K4TQF

The following is my take on packing delicate items. YMMV.
Irreplaceable or scarce tubes or items are worth some additional
packing time to lessen the chance of shipping/handling damage.

The goal is to decelerate the item after a shock in a somewhat linear
manner over a long enough time to minimize the peak g force
experienced and to return the item to it's original position for
continued protection.

The tube should be packed in a smaller carton inside a larger one
with the shock absorbing material.between.

Solid chunks of Styrofoam are not suitable for packing delicate
items. Way too ridged. Any g forces on the carton is transferred to
the packed item. Probably would protect the tube from breakage but
can allow the internal elements to be subjected to excessive g forces.

Styrofoam peanuts are better but if packed tightly enough to prevent
shifting do not have enough give to give the item much protection
from shock. Even if loose, may not produce a predictable suitable give.

Bubblewrap also is better but again does have enough give to afford
sufficient protection.

Foam rubber as in mattress pads etc is the best choice if installed
correctly. Egg carton cut foam rubber offers built in fingers and can
be used successfully. Continuous foam rubber for heavier items would
be appropriate but too much for lighter items will lessen the give
and decrease the protection.

For lighter items one way is to glue the ends of foam rubber fingers
from the inner to the outer carton in a sufficient quantity to
afford the desired protection considering the weight of the object.
The length of the fingers needs to be long enough so the inner carton
won't slam against the outer carton.

The end of the inner carton can be opened and the tube removed
without disturbing the foam rubber suspension so the box can be reused as is.

Egg carton cut foam rubber offers built in fingers and can be used
successfully. Continuous foam rubber for heavier items would be
appropriate but too much for lighter items will lessen the give and
decrease the protection.

The foam rubber suspension system is comparable to the original metal
frame and spring setup used on vintage tubes.

Ken S

I've had luck (so far) double boxing tubes etc. The item gets wrapped in bubble wrap then fitted in the smaller inner box. After that I pack the item/little box in a sturdy larger box packed with hand crumpled/balled up newspaper. The balled up newsprint idea originally came from Fair Radio Sales stuff I bought back in the Dymo-Tape days. Both boxes get taped with filament tape. Now.....a critical part....I use the US Postal Service for all my BoatAnchor shipping. UPS ( Universal Package Smashers) has croaked several well packed and non-replaceable pieces. I've never lost a BoatAnchor or part with USPS. Before I retired we used FedEx a lot, global shipping and third world countries, but even they had had some major mess-ups.

The other thing you have to look out for when buying tubes of this type and of WW2 vintage is that the metal to glass seals begin to or have been slowly leaking over the years and the tubes even if unused have gone gassy.

From: ab3ht@...
Topic: 6212  Message: 6212

I have modified my rf deck to feed the high voltage at the anode of the 4-400, rather than using the series feed through the output tank (as was the original setup)
I have a homebrew plate choke and rf capacitor installed in the conventional manner.
Use on 160 , 75-80 and 40 present no problems.
Last evening I tried out the Monday night 20 m group @ 14.330mhz.
seems my choke is resonant at 20m, or there about.
So.. question is, anyone have a good proven solution to this, I.E. do you know what choke will work?
Some info. garnered on the net tells me the B&W 800 may work, then others say the 802 model has to be used if 160m is desired.
Or, any ideas on how to home brew one that won't burn up on 20?
Thanks, Ed , AB3HT

175 turns of # 22 on a 1 inch diameter  piece of PVC should do.  Photo attached.  I'm not running a T-3, but I am driving a 4-400 using a T-3 exciter.

Good list.

The “Basic” (first) T-368 model did not include V23, the 6AH6 protective relay control tube and hence
no protection for the 6000 Intermediate Amp. in the event of excitation failure. The 6000 in turn appears
to be unique to the T-368. Anyone ever seen one in any other piece of equipment?

The 5933 Clamp tube is the military version of the “skinny” 807W. The metal shroud mounted above the
tube’s socket prevents the insertion and use of a “regular" 807 in this circuit.

# 6219. MFP - what chemicals were used?

Yahoo group: T-368_BC-610
Date: 2015-09-10 16:19:03 UTC
From: Roger@...
Topic: 6219  Message: 6219

Hi All,

A discussion on another forum caught my eye, it is regarding cleaning off old partially-removed MFP coatings from a BC-191 and whether there were any health risks likely to occur. Does anyone know the chemicals used in the original process and the method of application?

TIA,

Roger/G3VKM

FOR SALE: Hewlett Packard Oscilloscope model 1725A.
(Also military grade designation of AN/USM483.)

This is a medium sized, dual trace / 2-Channel, high performance scope.

This beautiful laboratory oscilloscope has an input voltage range of 10mV/div to 5 V/div vertical deflection. The scope is capable of providing CH A, CH B, ALT, CHOP, A+B, and A vs. B display modes as well as a 10 nS sweep rate expandable to 1 nS/div. It also has selectable impedance of 50 ohms RF to 1 Megohm input.
Vertical deflection factors of 10 mV/div to 5 V/div over the full bandwidth.
Available display modes of CH A, CH B, ALT, CHOP, A+B, & A vs. B
Sweep ranges from 10 ns/div to 0.5 Sec/div (24 ranges), 1-2-5 sequence.

Incorporates a single marker delayed sweep, and delta time measurement capabilities
For easy percentage measurements, reference lines of 0% and 100% amplitude are five divisions apart and markings for 10%, 20%, 80%, and 90% are also provided for easy transition time measurements.

Comes with the 120V AC power cable and original manual. No probes are included.

Looks very similar to the one shown here. If you need actual pictures I have to get my phone
camera to behave better (!)

This is an excellent working scope.

http://i.imgur.com/OQQ6f.jpg

There are two of these on eBay right now going for $199.00 and $389.00

Available for $139.00 plus shipping.

Sincerely,

Brian Carling AF4K

I bought one of these. Although I replaced the quad IEC outlet with two duplex US style outlets, it makes a good addition to any test bench if you rebuild boatanchors. I'll add that it can be connected for 240 VAC input and/or 240 VAC output. Good for anything up to and including a BC-610 or T-368/URT.

And it weighs a tonne!

FOR SALE

Heathkit QM-1 meter in excellent condition with original manual
Beautifully cared for by a gentleman who worked at a calibration lab.

Tests components at operating frequency-150 kc to 18 mc
Large 4½" 50 ua meter-easy to read dial scales
Measures Q, L, and distributed capacity of coils
No special alignment equipment required-test coil and manual included
Metered oscillator output for constant injection

The Q meter is not just a "prestige" instrument to be dusted off each morning when opening the shop or lab. It is fully capable of performing many tasks in a matter of minutes that ordinarily require considerable mechanical and mathematical dexterity. Originally a Q meter
was out of financial reach of the average service shop but now Heathkit ingenuity has brought it into line.

Suspected components and parts being developed or manufactured can be tested at frequencies at which they normally are used (150 kc to 18 mc). Wide ranges of inductance, capacitance and Q will cover practically all values encountered. All indications are read directly on a large 4½", 50 microampere, panel-mounted meter. Surprisingly easy to use, the model QM-1 will take the guesswork out of your electronic efforts.

The Heathkit Q Meter uses a 12AT7 oscillator with pre-wound coils to obtain the full frequency range on four bands. Oscillator output is metered to provide constant injection. A
complete VTVM circuit is used as a resonance indicator, using a 6AL5 twin diode and a 12AU7 VTVM amplifier. Voltage regulated and transformer operated power supply utilizes a 6X5 full wave rectifier and an OD3 regulator tube. All other components are of the highest quality.

Behind the attractive charcoal gray panel with white lettering is a well laid out and factory-formed chassis. No "extras" are required to build or operate this instrument. A special
test coil is provided for calibration purposes.

Specifications: Frequency: 150 kHz to 18 MHz on 4 bands. Inductance: 1 microhenry to 10 millihenrys. Q: 250 Full scale x 1 or x 2. Capacitance: Actual 40 mmf-450 mmf; Effective 40 mmf-400 mmf; Vernier ± 3 mmf. Tubes: 1-12AT7, 1-6AL5, 1-12AU7, 1-6X5, 1-0D3/VR150.

Power Requirements: 105-125 VAC, 50-60 cycles, 30 watts.

Dimensions: 8" high x 17" wide x 6" deep.

Complete with manual etc.
Available for $90.00 plus shipping.

Please contact me off the list to arrange purchase or for
pictures, details etc.

From: Bry Carling AF4K
Topic: 6229  Message: 6229

TOROTRON THP-05-AD - "Best of the Best" High-Pot Tester

The THP-AD series hipot insulation tester with voltage ranges from 0 to 5 kV.
It features a high-voltage output control that is continuously variable from zero to full voltage.

Looks like it is brand new.

Monitoring is via a 4.5-in. mirror-scale taut-band kilovoltmeter with
an accuracy of ±2% at full scale. Output cables are insulated for
three times the rated voltage of the model used.

This is a high grade piece of commercial equipment and looks new.
Was owned by a gentleman who worked at a calibration lab.

Made by Torotron Co. of Mount Vernon, NY

The list price is $575.00
There are some grubby looking ones on eBay from time to time for around $200 - $350.00
Available for $100.00 plus shipping

Please contact me off the list to arrange purchase or for
pictures, details etc.

Bry,

I'll take it, if you still have it! Let me know, and we'll figure out shipping and payment..

Thanks!!

Has anyone had any luck removing rust from the chassis of the I type models where they have yellow gold colored chassis. I pick one up last weekend and there are some spots that have quite a bit of rust .. not real bad but surface rust .. I'd love to just sand it off or use Navel Jelly and remove it and then color it back but I don't think that's going to happen .. I've looked every where on the internet and I can't find any thing that tells where or what that covering is. and I'm looking for a cable to go from the BC 614 to the BC 610 .. can't find one of those either .. I knew this was going to be a winter project but I had no idea that I might not get it done this winter LOL .. any help would be great guys..

The cable is rare. I made my own using rotator cable and a pair of RG174 coax
For the audio leads. The fatter pair of leads in the rotator cable I used for the
117 v power to the 614. There is a seller one bay selling the cable ends. He only
Has the male end and I was lucky enough to have a female socket in the junk
Box. Some black tape to tie it all together and a working light cable

The ‘yellow-gold’ color maybe Alodyn (spelling?), , , often used as a corrosion resistant chromate chemical to treat metal surfaces, usually in liquid form . . . I am guessing at this, without knowing if my T-3s have the coating . . . it is common and especially well known on cover plates for R300x’s . . . hope this puts u on the trail of a solution . . . btw, I’ve heard the treatment Is not that uncommon with the liquid found around auto shops and places where aircraft repairs and reconstruction is being done . . .

Don,

Unfortunately, I don't know how the chassis in the BC-610-I were originally finished.

I don't have any CD-764 (BC-610 to BC-614) left. But I do have a few NOS original connectors. $15 each plus shipping.

From: Alan Morriss
Topic: 6238  Message: 6238

hello gene , i had the same problem. you must remember that underneath the rust the original coating is still there. i had the same problem , and cured it easily. i used a phosphoric acid preparation. over here it is called jenolite. being a liquid it penetrates and turns the rust into iron phosphate . this is black and is similar to gun blue. after an hour or so , wipe it off with a soft damp cloth. i have done a lot of this on WW2 radios. alan G4GEN

Hello Alan and thank you for your input .. so after you removed the rust what did you coat the chassis with to keep it from coming back ..or what happened next ? Gene was just helping me with what he knows and I'm the one with the problem on the BC 610 I would love to get it back to the original color coating but my hopes are fading fast. I looked up the other coating that was mentioned on here and I found it was for aluminum only not steel so on ward I go .. I'm going to go to the auto repair stores and maybe I can find something there... you would think it wouldn't be no big deal what Hallacrafter put on the chassis .. LOL .. have a great weekend

Hello Gene .. my chassis are made of steel not aluminum so now we have to find a new dog to fight ... LOL... if it wasn't so much trouble I'd just paint the darn things but I want to restore it to some what like it was made .. my side panels have not a lot of rust but more then I can stand myself .. I had given it the idea of knocking off the loose stuff and I was wondering if stove pipe paint or what ever they call it might work .. it would look kinda like the wrinkled paint look with the rust and it would help the over all color .. and I'd just put some Vaseline over the white letters .. I don't know just looking for good results from an easy fix I guess

From: Gene Beckwith
Topic: 6232  Message: 6241

Well, the task of the restorer of heavy metal is often challenging. I did a quick search for Alodyne . . . (spelling is close) . . . and it is as I remembered, a chromate based compound . . . a bit toxic, but I never planned to take a shot of just for kicks . . . usual care and caution advised if you try it, as with any chemical situation . .

Btw…a group of us who meet on six meter AM on 50.4 at 1900Hrs nightly do a lot of heavy metal restoration, and operating, so always looking for ideas to help clean up our heavy metal gems . .. One of the most effective solutions we've tried was posted in an Electric Radio mag of a few months ago . . . it consists of---> equal parts of Murphy's Oil Soap, full strength unscented Ammonia, denatured alcohol and Acetone . . . it is ultra-effective in cleaning up heavy metal components . . . it is '''very stinky''' due to the Ammonia . .so, use obvious precautions for max ventilation . . . I usually mix up a total volume of a quart . . . put it in an empty soap spray bottle . . . spray on, or soak parts, then rinse thoroughly and then flush with distilled water . . . a little goes a long ways, so no need to prepare more than you need for any one project.

Best clean up material we've found . . mix only small volumes as needed . . it eventually changes color to an ever darker red . . . it's still vry effective . . . but, we don't know what chemistry is afoot that causes the slow color change . .btw…it is not intended to remove rust, but sure cleans up most other stuff on chassis and component surfaces . . .care and caution, if you try it . . .

Hello Gene .. my chassis are made of steel not aluminum so now we have to find a new dog to fight ... LOL... if it wasn't so much trouble I'd just paint the darn things but I want to restore it to some what like it was made .. my side panels have not a lot of rust but more then I can stand myself .. I had given it the idea of knocking off the loose stuff and I was wondering if stove pipe paint or what ever they call it might work .. it would look kinda like the wrinkled paint look with the rust and it would help the over all color .. and I'd just put some Vaseline over the white letters .. I don't know just looking for good results from an easy fix I guess

Has anyone had any luck removing rust from the chassis of the I type models where they have yellow gold colored chassis. I pick one up last weekend and there are some spots that have quite a bit of rust .. not real bad but surface rust .. I'd love to just sand it off or use Navel Jelly and remove it and then color it back but I don't think that's going to happen .. I've looked every where on the internet and I can't find any thing that tells where or what that covering is. and I'm looking for a cable to go from the BC 614 to the BC 610 .. can't find one of those either .. I knew this was going to be a winter project but I had no idea that I might not get it done this winter LOL .. any help would be great guys..

Brian,

The group here in NE Ohio is small but seems to be in pockets. . . We've had aprox seventy check in over the years, including openings . . . our group is centered in the greater Canton/Massillon area . . . we meet every night . . . at 1900hrs local . . . size of group varies . . . depends on weather, vacations, domestic needs, etc . . we met orig on 10M at 29.0Mhz AM . . . moved to six for better coverage with horizontal polarization . ..been meeting for probably abt seven or eight years after the move from 10M . ..no one remembers exactly . . . also same group meets for lunch on Tuesdays . . . mostly radio and techy chat . . .with show and tell of small projects and fest finds . . . we are not formal . . . no dues, no meetings other than lunch, no news letters to divert from doing real radio stuff . . focus is on repair, salvaging, and operating heavy metal and mil gear . . most are tech types, from domestic engineering and/or military electronics . . . a vry divers group of tech types . . .not sure why it works, but we do real hands on radio . . we push some buttons on the throwaways . . . but no one is in love with them at the expense of actual under the hood work . . . I do R390x salvage and rebuilds, and scratch build . . . currently just finishing a Gonsett G-50, one of the mainstays of the locals here . . . there is an LF guy with beacons . . another who does Drake, Heathkit, Swan, Kenwood tube type stuff as a sample of activity . . . we trade parts and expertise . . and operate too . .

Hope this might help for perspective on our 50.4 Am group . . . there are other here in Oh too…but a bit out of range for reg contact . . .

Many thanks Gene, great commentary and insights!

We HAD a group here in central FL on 6m AM a few years ago, but it died out.

I am going to try to get it going again, if I can find someone to take over the NOVICE ROUNDUP annual event!

I apologize for joining the topic drift here folks. Now to bring it back - does anybody know of
anyone ever making a T368 or BC610 go on the 6m band??

From: Bry Carling AF4K
Topic: 6245  Message: 6245

Reduced: Weller Soldering Station MP-101

Comes with the MP106 pencil, and works perfectly. This is a TOP QUALITY USA made product in excellent condition.

120V AC operation, fully tested and clean condition.
Picture here: (additional photos on request)
http://af4k.com/imag/ham/weller.jpg

Available for $39.00 plus shipping.

# 6246. Crystals For 75 meter Phone Band?

Yahoo group: T-368_BC-610
Date: 2015-11-06 15:10:15 UTC
From: Roger@...
Topic: 6246  Message: 6246

Hi All,

I've recently acquired several 100s of radio crystals of WW2 vintage onwards and am slowly sorting through them. There's at least two frequencies, 3892 kHz and 3958 kHz, which fall in the US 75m band (which we don't have in Europe, 3800 kHz is our upper edge). They are in the old British 10X holders which loosely fit the BC-610 tuning units, so are they of interest to '610 owners across the water? If so, I will see how many duplicates I can find (that work), then you can have a net!

73

Roger/G3VKM - Norfolk, England.

Link for convenience: http://www.ebay.com/itm/281744436130

That doesn't seem like a wise thing to risk to me, given the cost of those tubes. But then, the modulator tubes don't get dedicated forced air, so maybe it's not as risky as I think for AM voice operation in comfortably cool room? The quieter muffin fans on the back panel are probably fine for typical amateur duty, but I wouldn't feel comfortable running the PA without a chimney and forced air. Maybe replacing the original PA squirrel cage with a quieter fan would be OK for AM voice service?

Yes you can!! I did for years at least. My 4-400As were far more reliable than the strings of 8 series diodes per leg in a bridge.

I would think it has a lot to do with how much output power you are extracting from the beast. I regularly run mine at 500W of output power, at that level the plate on the 4-400 is showing color and I think I would want forced air cooling for the sake of tube longevity.

The Eimac spec sheet for the 4-400A definitely calls for forced air cooling. I would concede that a muffin fan blowing across the tube from the side “could" provide sufficient cooling for the plate seal but no way for all the pin seals on the bottom of the tube. The 4-400s substituted for 4-125s in the modulator (why?) would be loafing along so might survive without forced air given intermittent ham use.

The specs on the 3-1000Z in my HB linear, BTW, call for forced air ANY time the filament is lit whether or not any plate current is flowing.

Now that I think about this, I could be wrong. Somehow or another the amplifier I built had a big squirrel cage blower underneath the chassis. So perhaps it was blowing through the sockets. I really don't know.

When I was gainfully employed we had mechanical engineers who ran temperature and manometer tests on cabineted gear we built. There were times when muffin fans though rated at a certain cfm could not meet spec in other than unobstructed condition so we had to use squirrel cage blowers to get the needed cooling.

Ed,

The typical configuration is/was to blow air up through the tube socket across the bottom pin seals, then by means of a chimney arrangement enclosing the tube direct the airflow upward and across the plate seal at the top. Special tube sockets are available configured to accommodate the air flow at the base of the tube. Chimneys are typically made out of glass but the original unit in the T-368 was metal. A constriction is included at the top of the chimney to direct the air flow inward against the top (plate) seal.

As an aside, original chimneys for certain tubes like the 3-1000Z are hard to find and expensive when you do. I have been told by a guy who would know that a separate fan just for the plate seal is a safe alternative alternative (at least for Ham use) but I was lucky and found an original chimney when I built my linear 30 years ago.

Dennis

The Eimac 4-400 spec sheet clearly calls for forced air cooling. What kind of a configuration were you using?

hello , i spent many years using collins 618T aircraft transcievers. they used a pair of similar valves , 4CX250 if i remember correctly. they had a very noisy fan delivering air from the base up through a chimney. we were told that if the fan failed the heaters alone would destroy the valve. alan G3GEN

That's my understanding as well. T-368s were used for such things as RTTY and other heavy duty-cycle applications. Intermittent amateur use would pose no problem unless perhaps you're one of the long-winded AMers who rambles on for 10 minutes or more. Even then, I'd guess only the occasion voice peak is really going to tax the transmitter.

I've got a commercial 1KW input transmitter that runs a pair of 4-250s in it, squirrel cage blower fastened on the back panel below the RF deck blowing up through. No chimneys. The tubes can get plenty red when tuned properly with plenty of audio. No issues.

FOR SALE - Beautiful Drake MN2000 Tuner.

I will sell the excellent Drake MN2000 for $190.00 plus shipping.

It is superior to most I have seen, and is hard to tell that it is not new.

Anyone interested, please send an e-mail off the list please.

Pictures and details are available.

FOR SALE - several Heathkit Items!

Heathkit HD1 - Harmonic Distortion Analyzer - excellent.
ypically $25 to $60 on eBay.
Available for $15.00
With Manual for $24.00

Heathkit IM17 Voltmeter - excellent - looks new.
http://www.heathkit.nu/heathkit_nu_IM-17.html
With probes and carry case - typically $30 to 65 on eBay
Available for $25.00 plus shipping

Heathkit MT1 Transmitter - looks very good - $75.00
Heathkit UT1 power supply for use with the MT1
on 120V AC - very nice - $45.00
Both together for $110.00 plus shipping

Heathkit SB10 SSB Generator - looks excellent - $95.00

Shipping additional for all the above.

Some of these have pictures at:
http://af4k.com/radios.htm

Other pictures and details on request.

Peter,

From what you've described and from what I've seen and depending on
overall its condition 400-500 US $.
Unfortunately, I'm old enough to remember when one could get nice ART-13s
for $60-75 US $.

If it's really pristine and complete and you can connect with a buyer who is specifically interested in it, I'd say possibly higher (also I have no idea of their scarcity/ desirability/ usual condition in DK-land). Even when I was looking for an operable one when I lived in -2 land in the mid-late 80s, they'd become surprisingly scarce (though not yet high priced) and I eventually settled for a scruffy but complete and operable one that had been in a barn...

73
Trevor
KD1YT

PS, if it is a really complete/ clean "set" (hams nearly always ditched the dynamotors, or didn't buy them in the first place) it would be wonderful if it could be united with a historically appropriate setting...

A full set of connectors is seven. My current prices on them are $18 x 2 + $30 x 3 + $35 x 2. Or $196. I've seen some of them go for more. If the cables are original (I have only ever seen one set) or made up by someone who knew what he was doing, add about $100. The last DY-17A (final verions of the dynamotor) NOSB that I sold was in mid-2000 @ $90.00. So double that today. The transmitter with all of the tubes $250 to $375 depending upon condition and which of several models it is. If it includes the C-87 control box, add probably $55 today (they were $35 NOSB a decade ago). If it is sitting on the MT-284 shock mount, I never had one (most were scrapped with the aircraft and they are extremely rare) but I'd guess $200-$250. There are also several other bits but few people ever had them. The whole lot, strangely enough, could probably be had for 65-75% of the individual totals.

From: w4ax.mack@...
Topic: 6272  Message: 6272

I have a very nice BC-610 India model. I can highly recommend this VFO to drive it if you want a frequency agile radio. Hagerty Radio Company http://www.wa1ffl.com/

http://www.wa1ffl.com/

Hagerty Radio Company http://www.wa1ffl.com/ WA1FFL.com - DDS-VFO, AD9951, Direct-Digital VFO, amateur radio

View on www.wa1ffl.com http://www.wa1ffl.com/
Preview by Yahoo

For the record I have no financial or personal relationship with the owner. I'm just a very happy customer. Jim can custom program the VFO for the proper frequency multiplier settings the 610 uses. You can give him my callsign and he can program the same chip that I used.

From: Bry Carling AF4K
Topic: 6273  Message: 6273

FOR SALE:

Collins Part Number 672N243 "RADIO POWER TRANSFORMER"

Primary 105 - 125V AC

SEC No1 - 15.6V at 1 Amp
SEC No2 - 12.6v CT at 3.5 Amp

This is a very conservative rating. transformer can deliver more no doubt about that.
This is brand new in the original (unusual) box. Includes the instruction sheet.

Available for $35.00 plus shipping.

See pictures and details at:
http://af4k.com/miscpart.htm

A year and a half ago I bought a VG ART13B for $185 at the West Coast Military Radio Collectors Group meet in San Luis Obispo. The seller, Andy KD6TKX, threw in a beat looking DY-12 dynamotor that I was able to save.

Just a heads up on something I found and I really like it as of now. I was looking at Eastwood products and I was looking at coatings for my BC 610 I model which has the Chromate plated chassis and it had a silly looking gold color and it took 3 different cans to make it look like it had the different color tints to it .. well I found something else they had and it's call Carb Renew II Bronze .. now this stuff looks almost just like what's already on my chassis and I just cleaned the rust off and spayed it on .. it's a really dull finish but it's just like what was on there the color is almost a perfect match. I'm really happy with it so far .. it's made to go on your car's carb so it's fuel resistant and it's suppose to replicate the original zinc Chromate plating. And it just doesn't have the funky gold color .. it more of a brass I'd say .. Just wanted to throw that out and if anyone wants to see some pictures I'd be glad to send you some ..

Why not try one of the UK SDR sites? This one is good:-

http://hackgreensdr.org:8901/ http://hackgreensdr.org:8901/

3615 kHz is the main AM UK channel and 3705 kHz for AM stations in Holland.

Peter,

Based on nameplate details, there were actually eight variants of the transmitter commonly (and incorrectly) referred to as "the ART-13". These are the eight different radio sets that one or another version of the transmitter was a part of ; ATC, ATC-1, TCZ, TCZ-1, TCZ-2, AN/ART-13, AN/ART-13A and AN/ART-13B. Plus there were the AN/ARC-8, AN/MRC-20 and AN/MRC-35. If you can send me a photograph of the nameplate that should be on the right end of the transmitter, I can tell you which manual or manuals apply and what a hard copy of each would cost shipped to Germany.

The TCZ-1 was a shipboard variant of the ATC that originally came with a 115 VAC operated rectifier and motor-generator power supply. Several years ago, I took the schematic of that unit, deleted all of the shipboard remote control components, changed the M-G Set to a 28 VDC rectifier supply, and made a generic schematic for a rectifier power supply suitable for operating any of the the transmitters. I'll email you a PDF of this if you want it.

From: Alan Morriss
Topic: 6287  Message: 6287

hello , when i was on DC4s in the early 60s we had them plus a BC348 . they were jolly good , but the R/Os would never let us dim pilots touch them . on the way to australia with a rocket for woomera , frequently the R/O would have been in touch with sydney on the key by the time we had reached marseilles. when not necessary for communication , they would tune the 348 in to the BBC so we could listen to the news etc. alan

Hello Robert,
at the right side I found the nameplate:
Royal Canadian Air Force
Transmitter Air T-47A /ART13

reconditioned and overhauled in may 1961
there is a reference number
also a serial number

I found a date on one capacitor: June 1945

I have put the ART13 on my receiver R390A beside the BC610
I'm constructing a powersupply,
all the tubes are already glowing,only the voltage is still low,abt 24volts dc
I will improve this tomorrow,will let the tubes for some hours glowing without anode voltage, to bring them back to life.
should I lubricate the internal mechanics?
I have original machine gun oil from the WW2,
the American soldiers forgot this at the railroad station here, so my mother had plenty of oil to lubricate
her sewing-machine for the 50s,60s,70s,80s and so.
the transmitter looks pretty nice,no rust in the interior,
I can send you photos,to what email address?
best regards,
Peter

Hello Peter,

Congratulations for getting your ART-13 on the air. I have a couple of them myself, plus the Russian version (R-807). I had them on the air using the dynamotors. My model PP-1104 28 V/50 A military surplus power supply presently is not operational (several old rectifier diodes failed) and I just need to take it apart and replace the 10 diodes in it.

First, regarding the 40 W output from your ART-13 on CW: are all the voltages up to what is specified in the manual? Are you loading the transmitter output directly into 50 ohms?

Just so you're aware of it, the ART-13 output network is not designed to load into a 50 ohm system. If you're using it on the 80 m band, you should connect a 500 pf capacitor from the antenna terminal to ground. The output circuit of the ART-13 needs the additional capacitance to load into 50 ohms. On 40 m it should work with a lower capacitance parallel to the output.

There is a great resource for tuning the ART-13 on the various amateur bands, for restoration and maintenance on this website: http://www.radioblvd.com/art13.htm .

With the specified voltages on the ART-13 you should be getting out at least 100-120 W easy on CW when properly loaded.

Good luck and keep us posted!

73, Meir WF2U

FOR SALE - Heathkit HO-10 monitor scope.

If anyone could use it - I have a SPARE Heathkit HO-10 for sale.
I think it uses the same red knobs as are on the DX100B concentric loading controls etc. (VERY hard to find!)
It would need some repairs - a couple of the controls are bent. From an estate, so not sure what else is needed. A good parts source for sure. Available for parts at $25.00 plus shipping.

Hello to all
and especially to Meir WF2U
you have been right,the voltage which should be 400V dropped to 320V ,so I added another transformer with 90V AC and that was it,power output on 40 and 80m slightly over 120watts,only on 80m there is an additional capacitor needed for loading,abt 300uuF to the 50 ohm coaxial cable.the powersupply is no beauty,consists of 2 parts ,one for heating 28V DC and the other for the high voltages (1100V,410V),but does the job well.
only the clattering of the relay in CW is nerve racking,the PTO is very stable,that is what the BC610 needs.
I have there a project to solve this problem for the BC610 (may be in the next year)
happy christmas to all and good luck in the new year!

The clacking relays are a minor noise in the scheme of things. The dynamotor is a constant background noise in the CW mode, although not objectionable if well maintained. Since I always use headphones for CW work (and also on AM with military gear that originally didn't use speakers, such as the BC-348), the dynamotor is barely audible. I'd never modify original military radios for a perceived "convenience" or for anything else - if anything, in case I get some surplus equipment that was modified, I restore it the way it is supposed to be and to be functioning when issued.

YMMV...

hello peter , i would not do any modifications to your ART 13 once you do it is no longer an ART13 ! you would be better with a modern rig. regarding the BC610 VFO , the best thing to do is to build or buy something like the "multi rock" stable frequency source , and make up a lead of small diameter coax with an old xtal at the end. just plug it in to the xtal socket on the vfo . jan PA3HCO has done iit , with very good results. i am sure he would be glad to help . mine works fine , but my BC610 is unserviceable just now. alan G4GEN

USN at least did some BC-610's that way probably in the late 1940's. In 1967 I "inherited" a BC-610-F and multi-band outboard VFO from NRTF, Ruston, LA that had been used there in the 1950's. Worked pretty well so long as you didn't hit the VFO with anything.

concerning "my" BC610 VFO project:I have the VFO part of an old German Lorenz receiver with ceramic coils and temperatur compensated capacitors for 2 to 9mc in 5 sections which I want to built in an old defective tuning unit,so the BC610 will generate its own variable frequency himself with his own tube complement without the help of an outside generator and it will leave the BC610 untouched because I can let the tuning unit vanish whenever I want it.I am no friend of drilling additional holes in an old time equipment, thats like a sacrileg.
thanks to all for giving helpful inspirations.

That's a very good idea, Peter. I think it might be possible to fit one of the DDS VFO kits and a suitable buffer stage to drive the BC-610 6V6 oscillator inside a old tuning unit. I have a few scrap TUs that have been used for spares, so I don't need to modify a working unit.

That should work well. However, be careful, solid state stuff does not like RF all that much. So, use a lot of filtering to the DDS as well as shielding. 73 & Merry Christmas to all – Mike

hello , i would never drill a hole in my BC610 ! what i envisage is feeding the small diameter coax through a vent at the rear or similar. this would shield it from the RF , as i also built it into a diecast box. i would say that having it inside would be disastrous. jan has had great success with his set up. so far i just use xtals. alan G4GEN

Alan,
I have 3 wrecks of the Lorenz receiver 6P203 , 2 hopelessly irreparable,one may be possible to repair,but it has no case,and I have one in good order original state.the common opinion is that this receiver isn't a good one,but I think if one adds a product detector (an additional tube,BFO is present) it would give a useful receiver,covering shortwave from 1500kcs to 8,5mcs in 5 bands.I found the oscillator parts in a nice state with little ceramic coils of abt 1.5cm diameter.and I thought that these parts would give a nice VFO for theBC610.
this receiver is rather stable over its full range and if one uses all capacitors incl. the main variable condensor
it should be possible to built an oscillator for the BC610,but I think one should use the first harmonic to prevent chirp effects.In my BC610 the oscillator is continuously running,I'm keying the both neutralized 807 which has the advantage that they can run in class B on the same frequency.I have added much shielding, I think you will not do so but I have not drilled any hole in this transmitter.neutralisation was easy.the last modification I made was to replace the 250TH by an RS384,it is the same as the Russian GU81M, and this tube works without complications,its so big that she fits only without socket in the case,output is on 40m over 600watts,if one wants but I am anxious abt the power supply.the RS384 will not become a red anode.
you see a BC610 has enough room for some experiments,but you should take great care of the high voltages.the last thing is indeed the VFO,it must be improved.The OM from which the ART13 is has also a very old Lorenz receiver,I think that is the one which would exactly fit to your transmitter the LO6 K39A,but he said to me,this receiver is traded abt 2000EUR,that is somewhat to dear for me,and its only an Audion,
regenerative receiver because the Germans have been afraid to be detected and located if these receivers are used in submarines.the corresponding Lorenz transmitter looks very simple,but you should keep in mind that the Germans had made great progresses in using ceramics that allows nearly perfect frequency stability using coils on ceramic and so on,before WW2,real frequency variable oscillators,not fixed at quartz frequencies.Alan,if you are interested, I can collect the most important parts of one of the Lorenz wrecks to ship it to you.the OM has also some other German WW2 stuff,I am not so interested in,can tell you later,so this night the ART13 left switched off,must answer you.
73 good night

Peter,

Sorry for the delay.

There are several manuals that are applicable to AN/ART-13A, of which TU-47A/ART-13 is a part. The best Maintenance Manual is AN 16-30ART13-4 dated 8 March 1949, last revised 15 September 1954. The final version of the Operations Manual is T.O. 12R2-2ART13-1 original date 17 September 1944 final revision 26 September 1968. And the Overhaul Manual is NAVAER 16-30ART13-501 dated 1 December 1948. There are earlier versions of the first two which would probably be OK for your purposes but I won't list all of them as there are more than 20 total.

I imagine that the machine gun oil would be OK to use. You will also need a medium viscosity grease for all of the gears. The lubrication instructions are included in the Maintenance Manual.

Hello,thank you for all the informations concerning the ART13.this transmitter works nice,but has chirp,is that ok or is that due to unstable power supply voltages,is there a cure possible?power output is on 20m over 90 watts,on 40 and 80m over 120watts at abt 1100volts 813 anode and 400 volts the other high voltage.mostly I have the lid removed for to look at the tubes(should I replace the lid?), the last 1625 has a blue halo inside nearest the glass envelope also the 837oscillator tube, but they are working.the oscillator is stable,makes working the transmitter a pleasure.I have not lubricated the transmitter ,I am afraid that oil comes to the clutches ,I think they should stay dry.mostly I do manual tuning,but the automatics are also working and nice to look how mysterious it works.the oil from WW2 is from the Gulf oil corporation order no.727-43-19001 FS DA 1-Quart oil lubricating for aircraft instruments and machine guns USA specification 2-27-E Gulf BLDG Pittsburgh,PA.I have one sealed container abt one liter(?) and one already opened, the rest was already used for sewing machine and so.I think it's from 1943, how curious it is that it finds now its way to an American airborne transmitter after so long time.Concerning the manuals,I try to make a copy of the one the retired OM has, I bought the ART13 from.he has his own ART13 but is not so often on the air.I will make no modifications to the ART13,it works so as it is wonderful.one last thing to tell is that the power supply producing the 28 volts made so strong RF noise which reached up to over 10 mcs, the old diodes were the cause for this interference, I replaced the old diodes and the noise in the receiver was away.
good luck in the new year!

hello peter , do not worry about the blue glow from the glass of the beam tetrodes. this is normal and caused by electrons striking the glass. for some reason i have found that not all 807s show it . you may have seen a maltese cross tube which is used for educational purposes. it is a bit like a cathode ray tube , and was indeed the fore runner. the anode consists of a maltese cross , and on the glass behind it there is a blue glow , except in the shadow of the anode. alan

I don't recall about the chirp (haven't had a 52286 or T-47 on the air in decades) but don't think that's normal.

If you follow the lubrication instructions in the manual, you aren't going to get any oil on the clutches. After probably 50+ years, it definitely needs a lube job.

Hello,thank you again for all,I's so nice to stay in discussion with you. First I can say,I keep the old BC610E from Feb.1945 and now this wonderful ART13 also from 1945 as remembrance-pieces of WW2, being so thankful that the Allies liberated us Germans from Nazi-dictatorship, I'm postwar generation but my father had no good opinion of the Nazis,he couldn't understand why they deported so much Jews from Bonn,he lived together with,often poor Jews.He was first in France in the little village of Locmine/Bretagne and then in Russia at temperatures of abt -40 C, he came back with Bomb splinters in his hands not irritating him.There are many Germans ,suffering from Nazi's terrorism.The common opinion is,that the Nazi's had to start the war,because scientific and technical progress were at that time enormous, so the high armoured German military runs the risk of starting later with outdated material.We should not admire (the unripe state of) rockets like V1 or V2 or the aircraft Me262.I could never understand how people could elect such an obvious fool dictator.Thank you for the link to "the end of German airforce" I will see it this afternoon,I was acquainted with General Steinhoff,he was at German airforce, he came so often with his horse along my meadow,but we had only short talks,his face was terribly burned from aircraft disaster (with Me262?) when landing.(I'm not sure,if this is the right place,to write abt all this)
Best wishes to all for the new year 2016!
Peter DK6KT

P.S. sometimes I think of so many BC610 sunk on ground of Atlantic by German submarines,exist there missing lists?

# 6320. T/R relay

Yahoo group: T-368_BC-610
Date: 2016-02-03 21:58:31 UTC
From: John Chmielewski
Topic: 6320  Message: 6320

Hello to the group. I now have 2 T-368's a C and an F. I just picked up the C and it is missing the T/R relay. Any help will be appreciated. Thanks.

John N2XD

# 6321. Setting Modulator Bias

Yahoo group: T-368_BC-610
Date: 2016-02-03 22:17:19 UTC
From: wc4don@...
Topic: 6321  Message: 6321

I have a T368 C model .. with the switch set to X20 ..I would like to know where to set my mod bias on the meter .. I've been setting it at 5 that's the number 5 on the dial .. I keep having a relay arc over on the mod deck and it only does it after 30 or 40 mins on the air .. talking ... I have cleaned the contacts several times and that's not helping so I'm going to just replace the whole relay with one I bought in another deck .. but I'd still like to know about the mod bias ..

Thanks and 73 Don WC4D

Chris,

Five (5) is where I have always used to set my “C” and now the “Basic” i’m using. Be sure to keep that meter switch clean though. Doesn’t take much crud there to start seeing uncertain readings.

Presume you suspect K3 here, the CW/Phone relay. Kinda hard to get a look at what’s going on with that unit when the radio is buttoned up for operation though. Does the problem seem to occur on key-on, key-off or while you’re talking? I would check the spacing on the spark gap on secondary of the mod former first before swapping the relay. Gap should be set at 0.0625inch. Spacing on the relay contacts when open should be considerably more than that BTW.

Thanks Dennis ..the problem always starts when I unkey and when I go to key it up again there is nothing on the output. And that relay back by the 5R4's will be arcing away. I seen it do it when I had the radio out from the wall one time. So I just thought that relay was going bad. I'll check the gap and hope maybe that is the problem.

Hmm…. That relay only operates when the Service Selector switch is turned to “AM” or “FSK-AM,” otherwise it de-energizes and a pair of contacts close and short out the secondary of the mod xformer. A second pair of contacts apply a high bias voltage to the modulator grids to cut the tubes off. HV all over the unit when the transmitter is keyed, though, so arc-over through bad insulation, bent contacts, etc., etc. certainly possible. Would be interested in knowing what you find.

Blew the HV filter choke in my “Basic” a few months ago. Had a sub luckily but horsing the bad unit off the PS chassis was a major pain. :^(

I set mine at 2.5, based on the operator manual indicating that bias should be 50mA. What are the effects of setting it at 100mA instead?

Hmmm…. Good question!

Meter set at 5 gives 100 ma total or 50 ma per tube resting current which works out to 125 watts dissipation per tube when you're not talking. This is right at the 4-125's max rating. That's kinda high but apparently not fatal as I've been running mine for many years that way. Now, the only info I can find in my library re the proper setting is a reference to "paras 18 and 20, TM 11-809-10" which I do not have. Mark, is that where you got the "2.5" figure? Anyway, I'm going to go down to the shack and make some checks. Suspect one might have to set the mike gain higher at "2.5" vs "5.0" but will report back.

Later…

OK, very interesting. The modulated RF waveforms as seen on scope definitely look "fuller" at "5" than they do at "2.5" even if one talks closer to the mike at the latter setting. Mark, you may remember that I have mentioned in the past that your audio seemed "thin" compared to your always excellent signal level? Maybe something relevant here. Anyway, I'm going to run my T-368 at "4" for a while (100W diss. per tube) and see what kind of reports result.

Actually...

TM 11-809-10 (incl. C1 through C5) says in Paragraphs 17-b-2 and 17-b-3:

2. Turn the EXCITATION METER SWITCH to the MOD PLATE X 20 position.

3. Adjust the MODULATION BIAS control until a reading of 60 ma is obtained
on the EXCITATION meter.

Which I assume would be a reading of 3 or 3.0 on the meter (I have never
owned or operated a T-368).

Anyway, I’m going to go down to the shack and make some checks. Suspect one might have to set the mike gain higher at “2.5” vs “5.0” but will report back.

I have a PDF of TM 11-809-10, dated May 1958, with changes 1 through 5.

Paragraph 17-b-3 states: "Adjust the MODULATOR BIAS control until a reading of 60 ma is obtained on the EXCITATION meter." Note that OCR errors are present; e.g. 17-b is titled "ATM Tuning Procedure".

The operational checklist in chapter 3 states "Approximately 50-ma reading on EXCITATION meter." as the normal reading, however.

I thought that I had recently read a different version of the TM which specified 50mA in the operating instructions. I'm having trouble finding it at the moment. Ah, there it is. It's also dated May 1958, but it's not the later OCR-ed reprint with changes 1-5. It calls for 50mA in paragraph 17-b-3, and the 60mA figure in the later scan is probably an OCR error. That's what I hate about the scans of older TMs from LOGSA: The things most likely to have OCR errors seem to be the most critical little details like current settings and torque specifications, and they are straight OCR text rather than searchable OCR text with the original bitmap image overlaid.

Ok, so I don't think I want to push the current all the way up to 100mA, but turning it up a bit from 50mA might help my audio. I won't do that until I have time to fix my problem of internal arcing on voice peaks, though. On the net last night, W6AQU suggested that I look at both the antenna changeover relay and the AM/CW relay as possible arcing sites. I'll do that, and I added some relay contact burnishing strips to my latest McMaster-Carr order.

My copy of the LOGSA PDF has the same ATM error (instead of AM) but says 50 ma both places as well as in the Operational Check List.

However, 17-d says in part "FIL VOLTAGE meter should read 6 to 6.2 volts.". Which is an error.

If anyone wants a TIF or PDF of the corrected Page 29, send me you email address.

Mark,

Went out this evening and hooked an audio oscillator up to the T-368 and adjusted the output level to get 100% modulation with the modulator resting current at “5” on the meter. I then reset the resting current
to 2.5 on the meter and found that with the same audio input level as before the modulation dropped to about 85 - 90%. Don’t think the difference would be noticeable on the air, though. Would conclude from this that the modulator resting current setting is NOT critical audio-wise but a setting higher than 5 would likely shorten the life of the 4-125s. Plan to run my T-3 at “4” or less from now on.

Dennis

Dennis:

On my TRW F Series T-368, I kept the resting current at the book value of 50ma (2.5 on the meter). I then used an audio osc and THD meter and worked for minimum distortion at 50 percent modulation (easy scope value); then I left the front audio pot there and adjusted my modified D-104 to provide the correct level to take it to 100 percent. My auto deck contained the well published audio mods and the RF deck had received the mods also. No problem getting plenty of modulation, a great sounding signal was had by all. Save the tubes, you should be able to get full modulation with lower resting currents.

Roger,

Wonder what you used to demodulate the audio before you fed it into the THD meter, I want to do something similar.

Mark WA1QHQ

Mark:

I actually had a self powered 6H6 as a linear diode in a mini-box that had been built to use during "proof of performance" reports required by the FCC for broadcasters way back when. I used a small coil of wire at the end of a short piece of coax that lead out from near the tank coil. You can build a small linear detector with an RF choke and a 1N34 today. There are several schematics over on AMFONE.net. A lot of the old Broadcast Transmitters included the pickup coil and a coax jack for running to an AM modulation meter which provided the linear diode detector; early ones had 6H6; later ones may have had 6AL5s.

# 6339. Carbon mic bias power supply current?

Yahoo group: T-368_BC-610
Date: 2016-02-08 20:25:01 UTC
From: Chris Farley
Topic: 6339  Message: 6339

Getting back to the T-368 control box project, and desire to utilize a small switching relay or two for receiver muting and some other things.  (T-368 provides a NO contact, whereas the receiver I'm using requires a NC contact).  I had the idea of possibly using the existing 12V carbon mic bias power supply to power these small relays, instead of utilizing 115V from the plate relay control, or bringing in external power from a wall wart.

Before I tap into the bias supply and use a resistor decade box or pot to load it down to figure out it's current capability, has anybody already played around and knows how much current it can supply?  There is a 200 ohm series resistor, which I suspect could be bypassed if absolutely necessary.  It's a rather odd little circuit, but filtered very well which is a plus.

Regards,
Chris kc9ieq

Bucky,

It's a heating element, actually. Used to be made by Eagle. I used to have a couple if I can find them. Someone probably still makes them. You might try an Ace Hardware run or owned by someone over 50.

It's purpose is that the TUNE-OPERATE switch on the transmitter, when thrown to TUNE, puts the resistor in series with the primary of the HV transformer on BC-610-E and earlier models. Reduces HV during tune. In the BC-610-F and later, the plate transformer has two 110 VAC primary windings. They are operated in parallel for OPERATE and in series for TUNE to accomplish the same function.

Yes,I have found one on eBay. A cone heater element. I looked at the schematics and all it is doing is dropping the input voltage to the high voltage transformer for the tune mode. (Learn something new every day!)I am removing the rf deck now to work on the underside of the oscillation boxes. That's a job just removing all the 1/4 inch bolts that hold it on. I am changing that AC input socket from a two prong to a three prong with ground. I have been bit by to many rigs cause they weren't grounded properly. I guess that I can adjust the resistance of the cone resistor if it was not the correct value.  I need 16 ohms.

hello , my D model had a substitute meter fitted. it was not much good. i managed to get an original one when the "asphidistra" radio station closed down. this gives db over 1 microvolt. the one which was in had an extra potentiometer for setting fitted. as far as i remember it is across the AGC line. you have to have the RF gain full for it to read correctly. you can download the manual from the VMARS website i should think. i will see if i can find any more info. alan G4GEN

Can anyone help me to identify where the two wires shown in my album(WB3GDA) photos go to? On a BC-610-E. One is connected to ground so what it goes to needs to be grounded. I cannot seem to trace them out and dont want to cut the harnes apart to trace them out. Also does anyone have a source for the switches that control the filament power, plate power, exciter and HV protect? One of the switches on mine is damaged.

Thanks

Bucky,

What is the TB or TS number of the terminal board or terminal strip visible
in the upper left corner of your two duplicate photos that show your
fingers?

How did you determine that one of the two wires is grounded?

Robert,
 The terminal strip to the upper left is TS1 and TS2. Some one prior to me had marked the two wires to go on TS1 terminals 1 and 3 but they look very much out of place there. Different size terminals on the wires and different color sleeves on them. I started to trace them out and found that one of them is at chassis ground. They do match the wires on RY3 and will reach there. It is very difficult to trace the wires in the wire harness without cutting the bundling string. And I don't want to do that. Hope this helps. I can make a short video if that would help?
Also I put the resistor R19 in place that you sent.

Well, I have traced out the wires in question. Using the schematics and the mechanical diagrams I have determined that the 2 wire do in fact  attach onto TS1 terminals 1 and 3. They are part of the exciter circuit. Many hours and lots of eye strain reading the manual but I think this is correct. So now the issue is no high voltage out put. Will be checking the primary voltage input tonight. All this in the repair and fun of old radios...

Time, T-368_BC-610@yahoogroups.com writes:

an anyone help me to identify where the two
wires shown in my album(WB3GDA) photos go to? On a BC-610-E.
One is connected to ground so what it goes to needs to be
grounded. I cannot seem to trace them out and dont want to
cut the harnes apart to trace them out. Also does anyone
have a source for the switches that control the filament
power, plate power, exciter and HV protect? One of the
switches on mine is damaged.

Thanks

Bucky

I received an email today about updating this group, but it will not accept my email which I receive my group communications at. surplus@...

I have always been able to do this before.

What is my email of record and my password?

I just view the posts as I am interested in what is going on with these transmitters, but it has been a long time since I actually communicated with any of the posters. I have been on the list for years.

Sincerely

Phillip Sellati

# 6358. BC-610m Tuning Units

Yahoo group: T-368_BC-610
Date: 2016-03-10 23:49:48 UTC
From: ironshaper62@...
Topic: 6358  Message: 6358

Well I have made head way with the high voltage on the BC-610-E. But ran into another issue. Are all the tuning units supposed to be the same? I have some that are wired different from one another and different from the tuning unit schematics in the manual. The Int. Amp. circuit is the one in question at this point. There should not be any connection on pin 9 , pin 10 is ground and pin 11 / 12 are the tuned LC circuit. This how the 610-E schematic shows how it should be. But some of the tuning units I have are wired with a connection on pin 9, pin 10 is ground, pin 11 attached to a coil that is terminated to ground and pin 12 to the variable capacitor.
Do the different models of the 610 use different tuning units?
Anyone have any knowledge of different tuning units?

Bucky

Topic: 6358  Message: 6359

Bucky,

Aside from any minor differences because the tuning units cover different frequencies, they were all originally wired the same. Any tuning unit should work in any model all the way from the HT-4 through T-213/GRC-26. Any TU that does not match the schematic showing in the manuals has been hacked.

I'm sorry that I did not answer your question on where the wires went before you found the answer yourself. I couldn't find my copy of TM 11-826. And I decided to quickly scan TM 11-4057 (which I have been promising to do for years) before looking for the answer. The scanning job took about four times longer than I expected and when I checked email before sending you the answer, read your message saying you had figured it out.

In the process of scanning TM 11-4057, I discovered that it did not include the -E wiring diagram (only the schematic). I did correct that by scanning the ones in TM 11-281. So if any of the several of you who have asked me about the TM 11-4057 still want one, aside from not yet having had the commercial outfit print some of the wide foldouts, it's now ready to print and bind.

*T-368 Transmitter FOR SALE*

'C' version RF deck & cabinet

Basic version Power Supply & Modulator

Located in north central Connecticut. Local Pickup Only.

Kept in a dry de-humidified basement since 1990.

Good condition, but was last run about 20 years ago.

No oil leakage from any transformers or chokes.

Right side of cabinet and small portion of top painted with a lighter gray color – as received from Fair Radio. Very small overspray on front, otherwise rest of cabinet is original paint.Pictures on request.

Plate meter is missing its outside glass.

Modifications have been made (mostly to the modulator deck) to add a slow release relay circuit and revise the CW keying circuit.All have been clearly documented on wiring diagrams.

Operating Manual (original), Maintenance Manual (copy) & Hex wrench included.

Spare parts included –

Two (2) NIB 4-400 tubes

Six (6) NIB 4-125 tubes

Four (4) NIB 6000 tubes

VFO/exciter assembly (not complete)

Audio driver assembly

Modulation transformer

Final tank coil

Final tank bandswitch

LOCAL PICKUP ONLY.

Removal will require going up a flight of cellar stairs. Two people, preferably three, and a heavy duty appliance mover will be required.

Price: $1200 Cash on pickup or Paypal

Peter,

Probably not. At least Hallicrafters never did it with any BC-610 model. HT-4-H would be post-war. Does it have a smooth one-piece front panel or two-piece? In the original HT-4 and in the BC-610-A through -E, the HIGH VOLTAGE PROTECT switch on the front panel switched an Eagle screw-in heating element in series with the HV transformer primary when in PROTECT or ON. Beginning with BC-610-F in 1948, the HV transformer had two 120 volt primaries which were in parallel for OFF or NORMAL and in series for ON. None of the other transformers have dual primaries. Check the wiring from the HIGH VOLTAGE PROTECT switch and see whether it does this or not.

Also, look at any of the other transformers and see whether or not they have two primary windings or just one with a tap. If none of them have dual primaries, then there is no practical way other than with an external step-down transformer.to operate the transmitter on 230 VAC.

Early versions of the T-368 had plate transformers with dual primary windings but no other provisions were included to allow 230 volt operation.

Thank you Robert for the quick answer.
the HT4H has an even one piece surface apart the black wrinkle paint
I think its from 1952
the HV transformer has 6 primary connections and 3 secondary
primary 2x 141volts with tap 117volts
secondary is clear,5760 volts @ .321A and 4800 volts @ .475A
is that transformer oversized???
it looks like more than a 2 kilowatt transformer
the transformer of the E model is smaller
is the poor 250TH not overexerted with all that much power?

No. Remember that the B-0610 and HT-4 is also a high level AM transmitter. For every 2 watts into the final, you need about 1 watt into the modulator. However, unless the HT-4-H was different, the high and low DC voltages are about 2500 and 2150.

From: K3PID
Topic: 6372  Message: 6373

OK, I found the small section in 11-809-35 that talks to the clipping setting. It looks like a trial-&-error cycle where you guess at a setting, button it up and run the “talking while turning the mike gain and monitoring the P A Plate current” test, then go back and adjust and do it again... is that right? Is there a better way?

On my T-368s i just back the clipping level way off in the minimum position and then using a scope set the front panel gain control to a point where I’m neither bumping into the base line nor flat-topping on voice peaks too often. I.e., just like running a voice rig without a clipper.

If I recall correctly, I backed off my clipper in the same way. I have an analog scope on top of my T-368C, dedicated to being a modulation monitor and connected to the antenna output with a home-made voltage divider.

Jan,

First question to answer is what radio or radios are in it or does he plan to put in it? By far the most common would be SCR-399-A/B. TM 11-281. I think I have one or two extras. Other sets were AN/MRC-1 and AN/MRC-2. Both require two HO-17's. AFAIK, the only manual done that is actually on the HO-17 is TM 11-2737 (reprint available). It covers adding Radio Set SCR-510 and Facsimile Set RC-58 to an existing SCR-399-A installation. No photos. and not much specifically on the HO-17 AN/GRC-38 is a similar (to SCR-399-C technically) post-war setup but it uses a later shelter.

I assume that this is in Europe. What country?

# 6380. BC-312-N Free for Pickup

Yahoo group: T-368_BC-610
Date: 2016-04-03 20:16:34 UTC
From: wa5cab@...
Topic: 6380  Message: 6380

W2ANZ says he has a restorable BC-312-N receiver free for pickup in Ivyland, PA. He's had it 45 years and says he last had it on 10-15 years ago. I have four photos I can send if anyone is interested. If it were within easy driving distance of Houston, I'd go get it myself.

According to Jon, it has been converted to AC. Rear photo shows that it has an RA-20 inside, so should be an easy un-mod for that. Front photos show original weird coax connector still present, and ungly plug still present. Front photos show spare fuse holder missing, and other two holders are twist type (probably no problem with that). Four jack covers missing. Upper two jacks missing and from two screw heads visible in photo, something mounted behind the two emply jack holes. It's a Farnsworth on a 1944 order.

Alan...I was wondering what I would use to restore the canvas on my HO 17 with. Your decking canvas fix answered that. Thank you.

Good luck to Jans friend with his HO 17 restoration.

Jan

This SCR 399 was built from scratch by a fellow in southern Calif whose name I cannot remember unfortunately. I remember though he obtained a original drawing package with dimensions of the shelter as made. I'll see if I can find him again.

In the meantime you can check out what he built

Hello group first everybody thanks for the reply
The shelter is going from the netherlands to belgium.
als the chest and the bc610 (after war)are already in belgium ,including the typewriter(i am jealous)
the shelter is in bad condition and needs to be rebuild.
the complete back is apart from the floor
the new owner wants to now the materials inside and outside and inbetween of the shelter .
and ofcourse when it is possible somebody who has already rebuilt a shelter
thanks everybody

*T-368 Transmitter FOR SALE ***Updated****

‘C’ version RF deck & cabinet
Basic version Power Supply & Modulator

Located in north central Connecticut. LOCAL PICKUP ONLY.

Good condition. Kept in a dry de-humidified basement since 1990 _and
just recently moved into my garage (street level) for this sale._
_R__ecently run into a dummy load – put out 500 watts on 80 & 40 M.__
__There is an occasional whistle from inside the cabinet when there is
HV on the final._
No oil leakage from any transformers or chokes.
Right side of cabinet and small portion of top painted with a lighter
gray color – as received from Fair Radio. Very small overspray on front,
otherwise rest of cabinet is original paint.Pictures available on request.
Plate meter is missing its outside glass. _Inner glass is present._

Modifications have been made (mostly to the modulator deck) to add a
slow release relay circuit and revise the PTT and CW keying circuits.All
have been clearly documented on wiring diagrams.

Operating Manual (original), Maintenance Manual (copy) & Hex wrench
included.

Spare parts included –
Two (2) NIB 4-400 tubes
Six (6) NIB 4-125 tubes
Four (4) NIB 6000 tubes
VFO/exciter assembly (not complete)
Audio driver assembly
Modulation transformer
Final tank coil
Final tank bandswitch

Price: $1200 Cash on pickup

Contact: genorman1@...

Hello to all,I'm looking for screws suitable to connect the cable strings to the decks,I think this are screws No 8 , 0.4 inch long , UNF, 36 turns per inch , 0.162 inch diameter,slot hat. I have noticed,that the original screws sometimes (too often) broke when fastening.unfortunately this screws are not available in DL-land.Who can help? Can one member of this group send to me in Germany a parcel of this screws in a better quality then the 60 years old types?
many thanks in advance for help,will bring this nice and rare transmitter back to life.

Peter,

Are you certain about the #8-36 UNF? I've never owned an HT-4 but have owned several BC-610's, at least one each of every model from BC-610-E through T-213/GRC-26. And I don't recall ever encountering that thread in one of them. That is a valid and readily available thread but even in the early 1950's, I can't recall but one major contractor (Teletype Corp) that routinely used UNF instead of #8-32 UNC machine screws for mundane tasks like cable clamps.

You also need to specify the head type more fully. Probably they are binding head but could be round head (or much less likely some other types). And although if you haven't misplaced any of the washers, they should be OK. But I would recommend you replace the hex nuts, for which you will need to specify the hex dimensions (width across the flats) as machine screw nuts are and were available in at least two sizes for most threads.

Also, machine screws are normally specified in fractional rather than decimal inches. And outside of custom orders are made in length increments of 1/16" (0.0625"). So the screw length is probably either 3/8" (0.375") or 7/16" (0.4375").

If no one else has already volunteered, contact me direct.
